How To Add Downloadable Files In WordPress

WordPress Training

In this tutorial, you will learn how to add, protect, manage, and share downloadable files and content in WordPress.

Complete this tutorial if you plan to add downloadable or shareable content to your site as part of your **content marketing plan**.

We also recommend completing the following tutorial, as it will help you better understand how to protect your downloadable files: [**How To Protect Your Content In WordPress Posts & Pages**](#)

What Kind Of Downloadable Files Can You Add To WordPress?

With WordPress, you can add just about any type of downloadable file to your content. This includes:

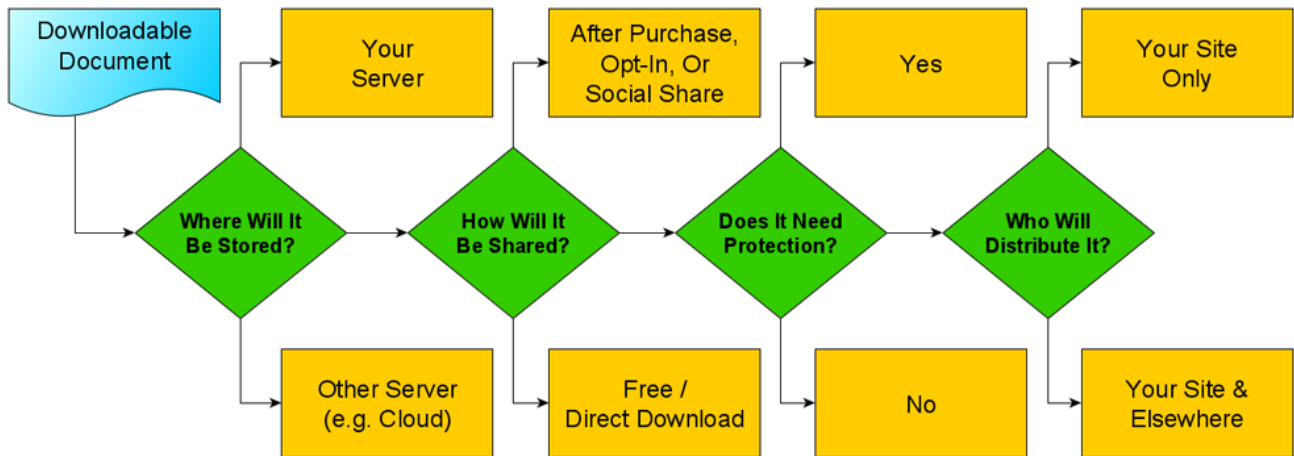

- Templates
- Checklists
- Price lists
- Product catalogs
- Brochures
- Case studies
- White papers
- Slides & presentations
- Media (videos, audios, images)
- Lead generation reports
- PDF files
- e-Books and guides
- Other digital information products

Additionally, you may want to protect your download files or content from being shared or accessed without your permission.

Downloadable Content Planning Process

Before you start sharing downloadable content online, it's helpful to plan your file downloading and sharing process.

Use the flowchart below as a guide:

Plan your file downloading and sharing process before you begin.

Here are some of the questions you should ask before adding downloadable content to your site:

- Where will the download file(s) be stored?
- How will the download file(s) be shared or distributed?
- Will the download file(s) or content need protection?
- Who will share and distribute the file(s)?

Let's go through each of these questions in a little more detail.

Where Will The Download Files Be Stored?

Your downloadable files need to be stored somewhere: either on your server (i.e. where your WordPress site is installed) or another location (e.g. a cloud storage service).

There are many benefits to storing and distributing downloadable files from a cloud storage service (e.g. Amazon S3, Dropbox, etc.). We'll discuss some of these benefits later.

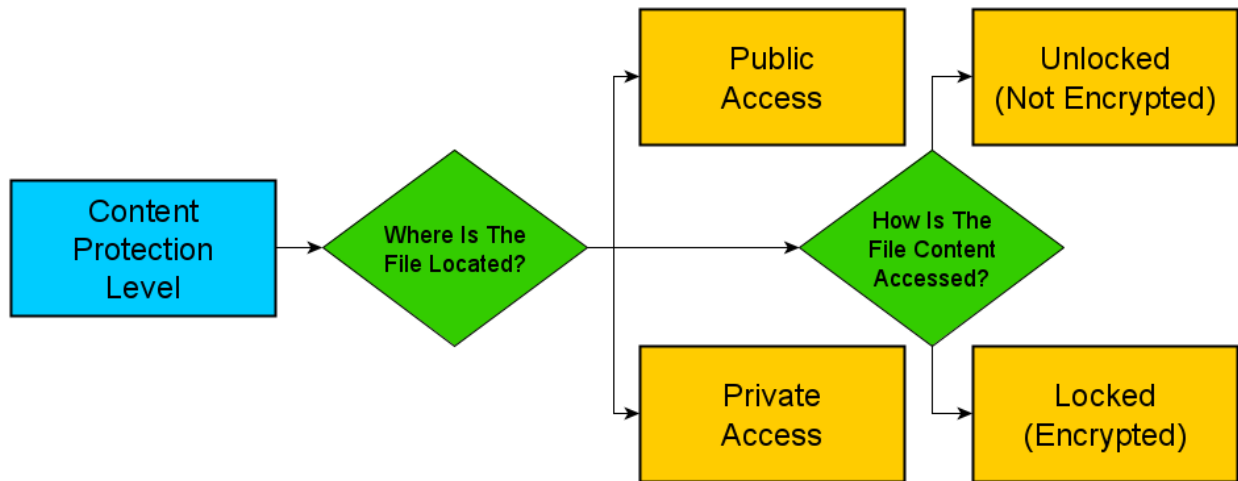

How Will The Download Files Be Distributed?

Do you plan to let users freely access and share your downloadable content, or will they only have access to this content after completing a purchase, signing up for your newsletter, or sharing it with their friends on social media?

Knowing how your downloadable files will be distributed will help you decide what additional pages, tools, plugins, etc. you will need to set up.

Will The Download Files Or Content Need Protection?

Depending on your strategy and whether you want to make your downloadable content freely available or accessible only after users take some form of action, another thing to consider is what level of protection your content will require.

How much protection will your downloadable files need?

For example, you may want to give access to a downloadable discount price list to account or trade customers.

In this case, you will probably want to store the file in a **private area of your site** that only certain users can access, but not necessarily need to protect the file content itself.

Instances where you may need a deeper level of content protection include things like:

- Limiting the number of downloads of a file.
- Giving access to confidential or encrypted files that need to be unlocked with a password.
- Distributing software that requires users to enter a license key to unlock and use the application.

Who Will Share And Distribute The Files?

Something else to consider when planning to distribute downloadable content is who is going to share and distribute your files.

Will users only be able to download the file from your site or will your file be available for downloading on other sites too?

This is important because if you don't plan this aspect of the process, things can quickly become unmanageable, especially things like keeping your content files up to date, tracking who has what and where they are keeping the files, etc.

How To Add Downloadable Files To WordPress

Now that we have looked at some of the planning questions and decisions you should make regarding adding downloadable or shareable content to your site, let's look at how to add, manage, and protect your downloadable files.

As mentioned earlier, you will need to store any files that you plan to make available for downloading or sharing either on your server or in a remote server location.

Storing Downloadable Files On Your Server

Storing files on your server can be done:

- Via the **WordPress Media Uploader**
- Via a file transfer program like **FTP**
- Via a server file uploading tool like **cPanel File Manager**

With WordPress, you can upload files directly into your posts or pages using certain plugins, **blocks**, or shortcodes, or via the **WordPress Media Library**.

To learn how to add files to the WordPress Media Library, see this tutorial: **How To Use The WordPress Media Library**.

WordPress supports uploading various file types using the media uploader:

Images

- .jpg
- .jpeg
- .png
- .gif
- .ico

Documents

- .pdf (Portable Document Format; Adobe Acrobat)
- .doc, .docx (Microsoft Word Document)
- .ppt, .pptx, .pps, .ppsx (Microsoft PowerPoint Presentation)
- .odt (OpenDocument Text Document)
- .xls, .xlsx (Microsoft Excel Document)
- .psd (Adobe Photoshop Document)

Audio

- .mp3
- .m4a
- .ogg

- .wav

Video

- .mp4, .m4v (MPEG-4)
- .mov (QuickTime)
- .wmv (Windows Media Video)
- .avi
- .mpg
- .ogv (Ogg)
- .3gp (3GPP)
- .3g2 (3GPP2)

[Click here to view the full list of file types supported by WordPress.](#)

Not all file types are allowed to be uploaded using the media uploader and not all web hosts allow files to be uploaded.

Additionally, your host may not allow large files to be uploaded to your server.

Contact your host if you experience any issues uploading large files to your server.

Uploading files to your WordPress Media Library is easy but it may not be the ideal way to handle downloadable or shareable files. It can also cause issues with your hosting, such as exceeding allowed bandwidth or exhausting server resources.

For this reason, you may want to consider storing and distributing your files from a cloud storage service like Amazon S3, Dropbox, etc.

How To Protect Downloadable Files In WordPress

You can protect a downloadable file and its content from being accessed by unauthorized users using a combination of:

- **Content protection methods** – this prevents unauthorized users from accessing the file, and
- **File protection methods** – this prevents people who download the file from being able to open the file.

Content Protection Methods

Some of the ways you can protect your downloadable files from being accessed by unauthorized users include using:

- Deep-nested pages
- Password-protected pages
- Private pages
- Content lockers
- Membership sites
- e-Commerce sites

The above methods are covered in more detail in this tutorial: [**How To Protect Content In WordPress**](#)

File Protection Methods

Protecting downloadable files from being opened by unauthorized users usually involves things like:

- Password-protecting the file – e.g. setting a password to unlock a PDF file.
- Encrypting the file – e.g. providing users with an encrypted and/or expiring URL to the download or ‘thank-you’ page.
- Issuing a license key – e.g. software licensing keys that unlock the software or give users access to upgrades or advanced features.

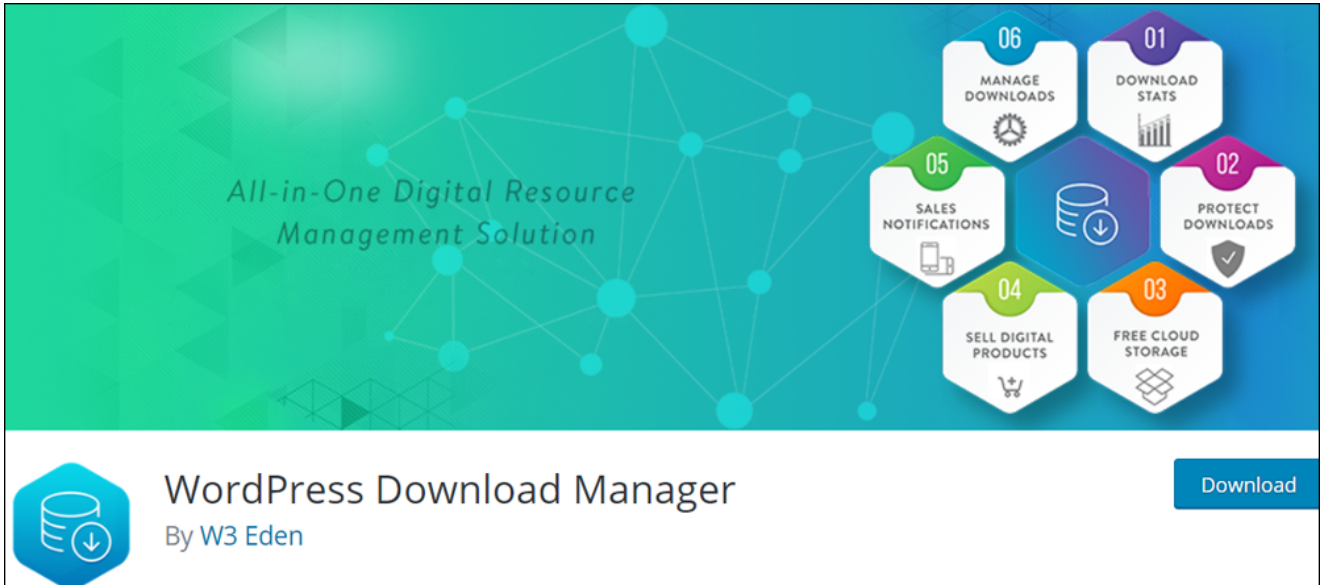

How To Manage Downloadable Files In WordPress

WordPress lets you manage your download files right out of the box but it doesn’t have advanced management features like:

- Download password protection
- Tracking file revisions
- Monitoring/restricting the number of downloads
- Preventing unregistered users from accessing your files
- Managing and selling digital downloads
- etc.

You can easily add these features using file management and download management plugins like the ones shown below:

WordPress Download Manager

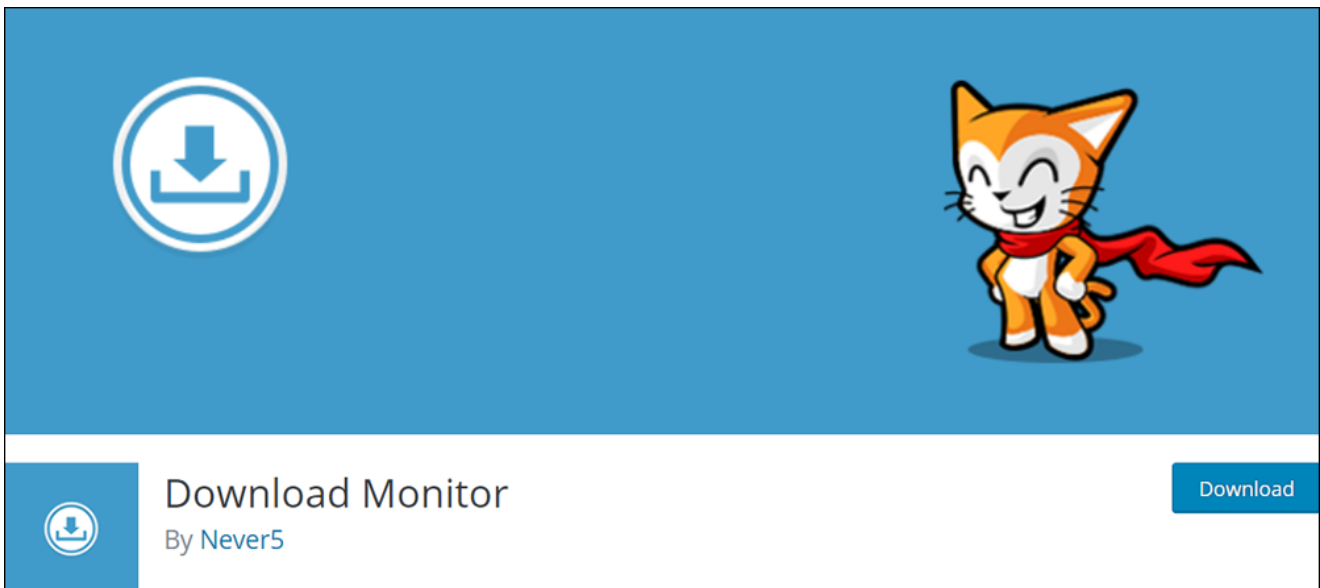

The banner features a green and blue background with a network diagram of nodes and lines. The text "All-in-One Digital Resource Management Solution" is centered. On the right, there are six numbered hexagonal icons: 01 (Download Stats), 02 (Protect Downloads), 03 (Free Cloud Storage), 04 (Sell Digital Products), 05 (Sales Notifications), and 06 (Manage Downloads). Below the banner, the plugin name "WordPress Download Manager" is displayed next to its icon (a blue hexagon with a database and download arrow), followed by "By W3 Eden" and a "Download" button.

WordPress Download Manager

WordPress Download Manager is a free WordPress plugin that lets you manage, track, and control file downloads from your WordPress dashboard. You can control access to your download files using passwords and user roles, control downloads by speed or by putting a limit on download count per user, block bots or unwanted users or spammers using Captcha Lock or IP Block feature, ask users to agree with your terms and conditions before they can download files, and even sell digital items and products.

WP-Filebase Pro

WP-Filebase Pro

WP-Filebase Pro is a plugin that keeps your download files structured in categories, comes with smart, mobile-responsive templates to embed files into your post or page content, and provides fast download features for users.

This plugin lets you securely sync files with an FTP server or use an extension for Dropbox, Google Drive, OneDrive, Amazon S3 (including Cloudfront), GitHub, ownCloud, and others. Files remain wherever they are uploaded and the WP-Filebase plugin handles permissions, URL signing, and redirects.

Additionally, the plugin scans your files for metadata and keywords, so your actual document content becomes searchable, lets you assign individual access and upload permissions per user or user-role, prevents direct, unauthenticated file access, and protects download files stored in the cloud.

S3 Media Maestro

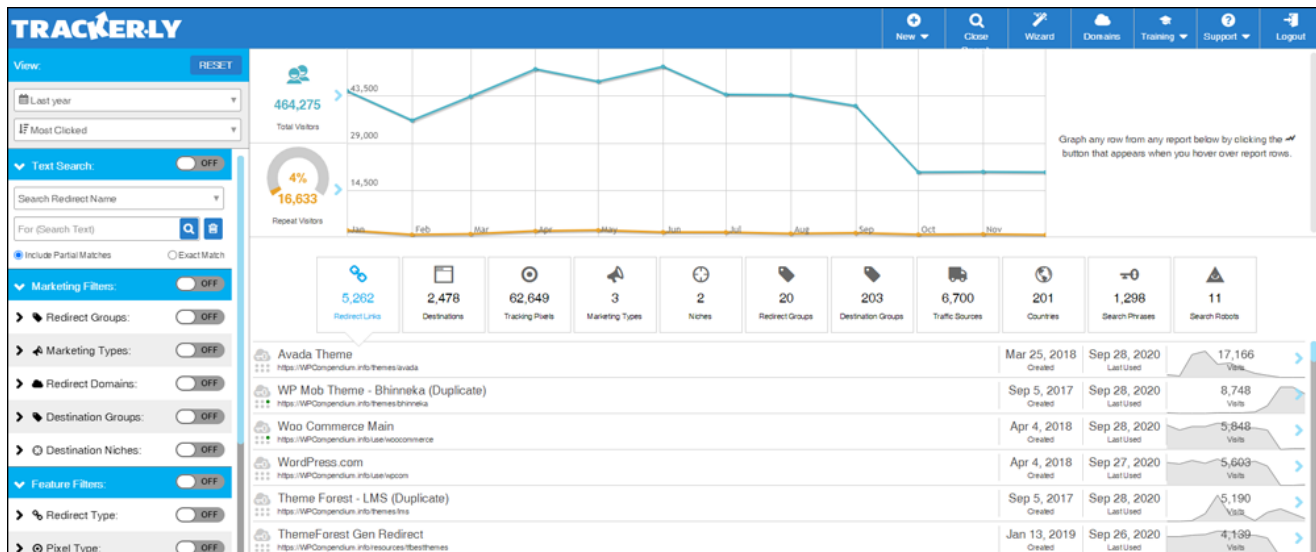

S3 Media Maestro – Media download plugin for WordPress

If you need a more robust solution for giving users access to your downloadable files, **S3 Media Maestro** is a WordPress plugin that protects your files from unauthorized sharing and lets you easily manage and deliver media or download files securely using Amazon's S3 web storage services.

This plugin can be used to set up online learning and video membership sites. It prevents paying customers from sharing links to your content with others by creating unique expiring links that will only work for your customer. Anyone else who tries to use the same link to your content will be denied access.

How To Distribute And Share Downloadable Content Effectively

Let's suppose that you distribute your products through different outlets.

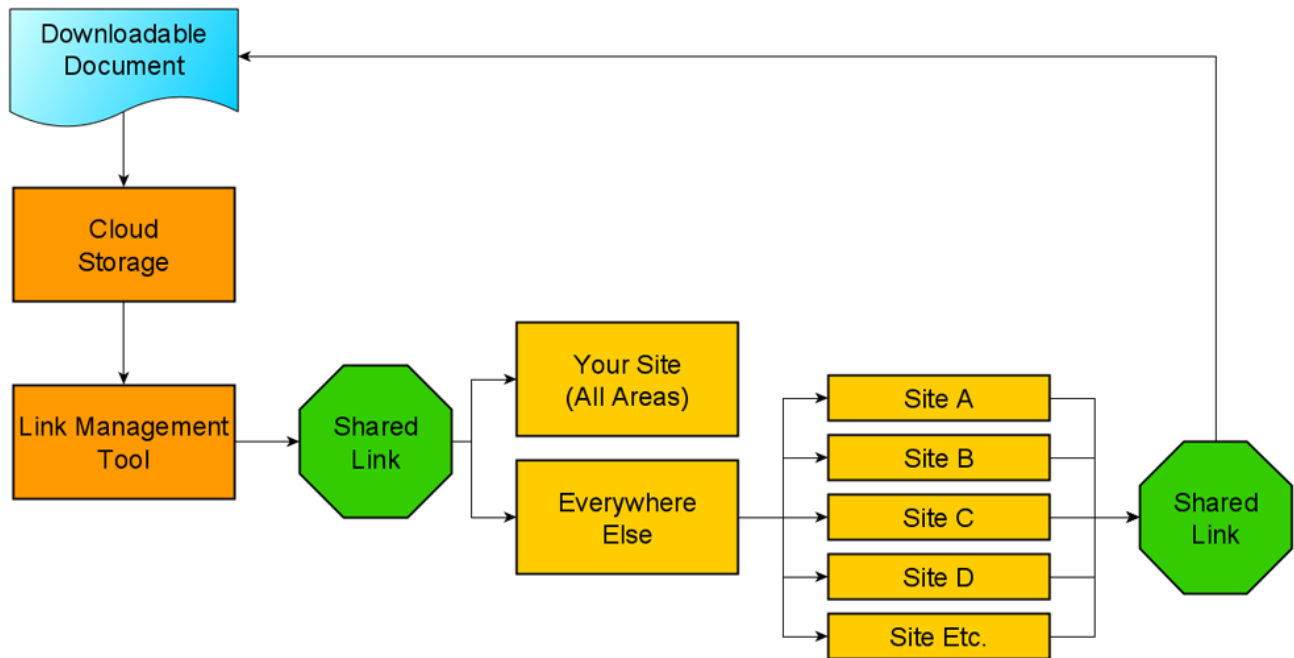

As part of your marketing strategy to increase product sales, you create an online catalog and encourage your distributors to promote your online catalog.

- Where will you store the catalog file?
- Will your distributors have access to a copy of your catalog file so their customers can download it from their website, or will they have to send their visitors to your site to download the catalog?
- If you store the catalog file on your server, how will you manage updates? Will you overwrite previous versions of your catalog? If so, what happens to the old versions? How will your distributors access older versions of the catalog if required?
- If distributors store the catalog file on their servers, how will catalogs be managed (e.g. what happens when the catalog needs updating)?

Once again, this highlights the importance of planning how your download files will be managed and distributed.

A Simple Model For Distributing Downloadable Content Effectively

Here is a simple and useful model for managing, distributing, and sharing your downloadable content effectively.

It's important to manage your downloadable content effectively.

First, you will need to set up a cloud storage service like Amazon S3 to upload and store all your downloadable files.

Next, set up a link management and redirection tool (e.g. **Trackerly**) to manage your download links.

Now, here's how to manage your downloadable/shareable content:

1. Upload your file to your cloud storage account.
2. Copy the link of your uploaded file and use it to create a redirection link in your link management tool.
3. This redirect link is the download link for your file. Use only this redirect link on your site and everywhere else you plan to make the file available.
4. Now, whenever your file needs updating, all you have to do is upload the new file to your cloud storage folder location and change the destination URL in your link redirection tool.
5. The download link will remain the same, but users will be redirected to the new destination URL. This will ensure that anyone who clicks on the download link from your site will always get the latest version of your file. In other words, you don't need to go through your site and edit pages to change links. All links on your site can remain exactly as they are.

Let's go through a practical example of the method described above:

Let's say you create a product catalog and name the file *XYZCatalog2018.pdf*.

First, upload file *XYZCatalog2018.pdf* to a folder on your cloud storage server (e.g. create a folder called 'catalogs').

If you use the Amazon S3 service, the URL where your file is located would then be something like this:

<https://xyz.s3.amazonaws.com/catalogs/XYZCatalog2018.pdf>

Next, copy the above URL, then create a new redirection link and paste the URL from your clipboard into your redirect link's destination.

If you use a tool like **Trackerly** you can create redirection links using your own domain name.

So, for example, if your domain was *xyzcompany.com*, your redirection link would look something like this:

<https://xyzcompany.com/catalog>

This is the link you will share and use everywhere for downloading your product catalog.

If you update your product catalog, just replace the old file stored on your Amazon S3 account with the updated file and everyone who clicks on the download link will get the new version.

Now, what if you want to create a new catalog each year (e.g. *XYZCatalog2019.pdf*, *XYZCatalog2020.pdf*, etc.)?

Here's a simple way to have users download the new catalog edition instead of the old one without having to change download links:

First, upload each new catalog file to the cloud into the 'catalogs' folder.

E.g:

- *XYZCatalog2018.pdf*
- *XYZCatalog2019.pdf*
- *XYZCatalog2020.pdf*
- *XYZCatalog2021.pdf*
- etc.

The URLs for each of the above files should look something like this:

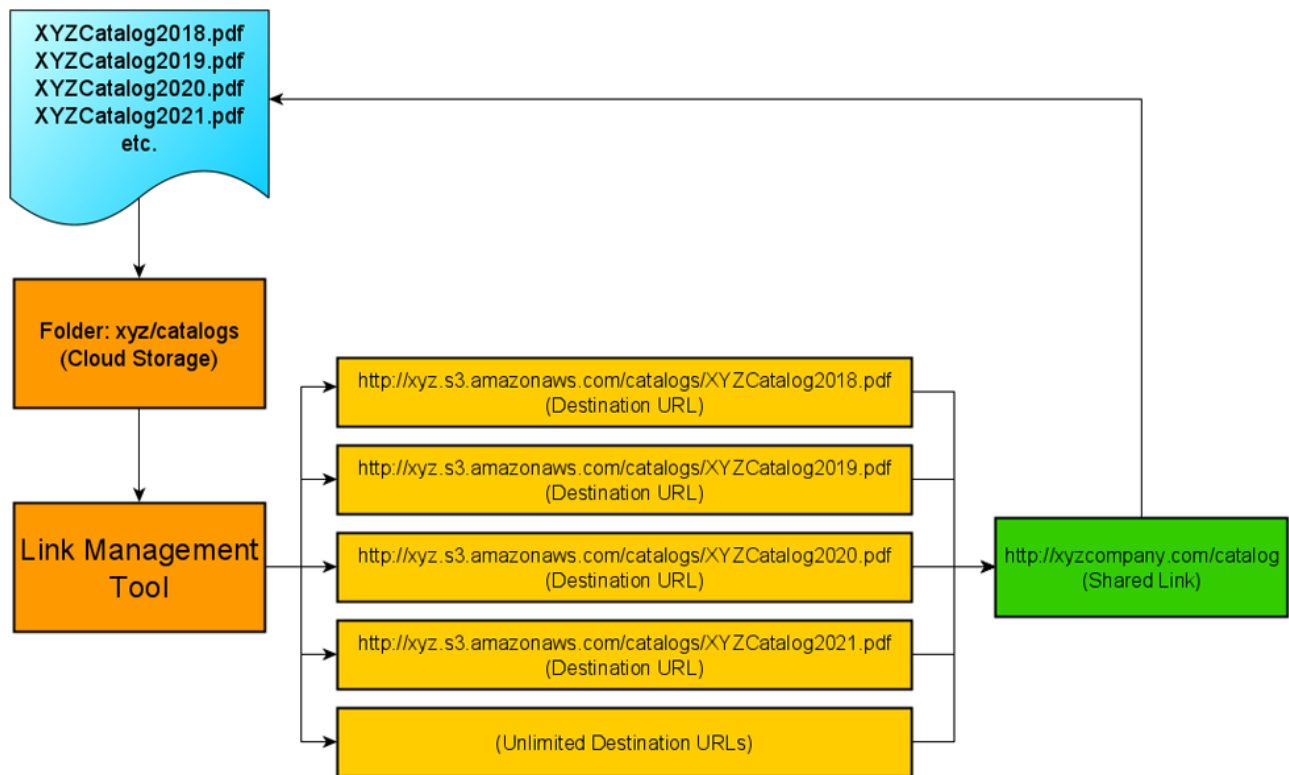

- <https://xyz.s3.amazonaws.com/catalogs/XYZCatalog2018.pdf>

- <https://xyz.s3.amazonaws.com/catalogs/XYZCatalog2019.pdf>
- <https://xyz.s3.amazonaws.com/catalogs/XYZCatalog2020.pdf>
- <https://xyz.s3.amazonaws.com/catalogs/XYZCatalog2021.pdf>
- etc.

Using your link management and redirection tool, your download link for the file would still be:

<https://xyzcompany.com/catalog>

Each year, however, all you would need to do is change the destination URL in your redirect link to point to the link of the latest version of your catalog.

You can easily manage and share download links using a link management tool.

With the above example, your call to action should be something generic like “Download the latest version of the XYZ catalog here ...” (i.e. don’t mention the year).

This way, you don’t need to change anything in your posts or pages. Everything will be managed from your cloud storage folder and your link redirection tool dashboard.

Also, if users need to download previous versions of your catalog, just create an archive or repository page and **add a table** or create a list with links to the older files.

An even simpler way to set up the above model is to name your downloadable file without referencing dates or version numbers. All other steps remain the same.

This way, all you do when new updates become available is rename your new file using the same filename as the old file, then upload it to your storage server overwriting the old file. You don't have to change any links at all.

If you want to keep old versions of your download files, just rename the old file in your server before uploading the new one. The new file will not overwrite the old one and you can create an archive of previous versions.

We hope that you have found the above information on adding, protecting, and managing downloadable files and content in WordPress useful.
