How To Use WordPress Menus

WordPress Training

In this tutorial, you will learn how to create, edit, and use custom navigation menus in WordPress.

This tutorial covers the following sections:

Overview of WordPress Menu Editor

WordPress provides a powerful and flexible built-in menu editor that lets you:

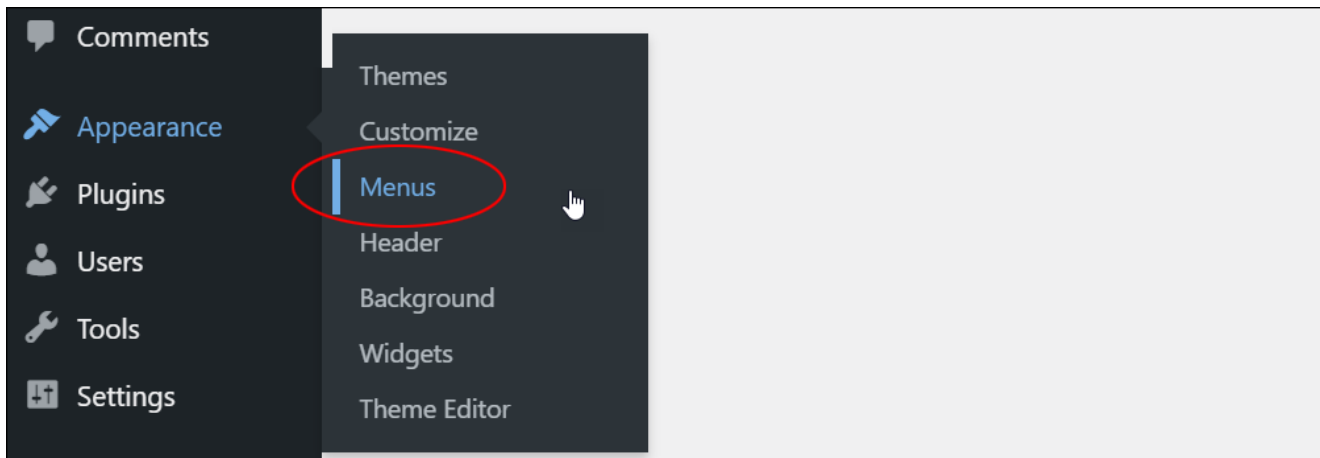

- Create multiple custom menus (as many as you like).
- Add different link types to each menu (e.g. pages, posts, product pages, categories, tags, external URLs, etc).
- Rearrange the order of your menu items using drag and drop or clicking ordering links.
- Organize menu items into hierarchical lists with submenus nested many levels deep.
- Automatically add links to menus when you add new pages, posts, etc. to your site.
- Place your custom navigation menus anywhere you like on your site (e.g. sidebar, header, footer, etc.) using **blocks** and **widgets**.

Notes:

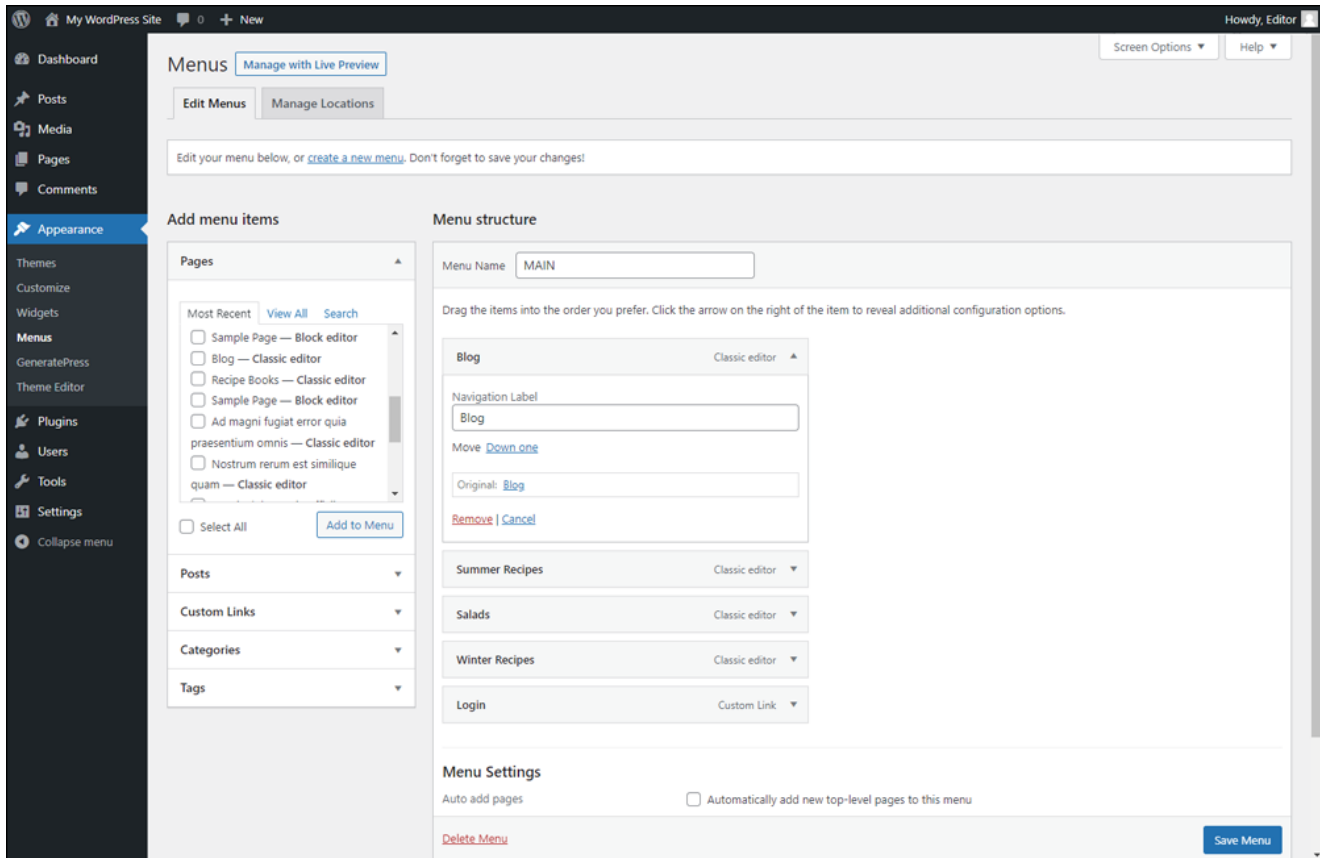

- Where and how you place menus on your site depends on your active **WordPress theme** and whether you are using the **WordPress Block Editor** or **WordPress Classic Editor**.
- Make sure that you already have added pages, posts, categories, etc. to your site before creating menus.

To access and manage your menus, log into your WordPress administration area and go to **Appearance > Menus**.

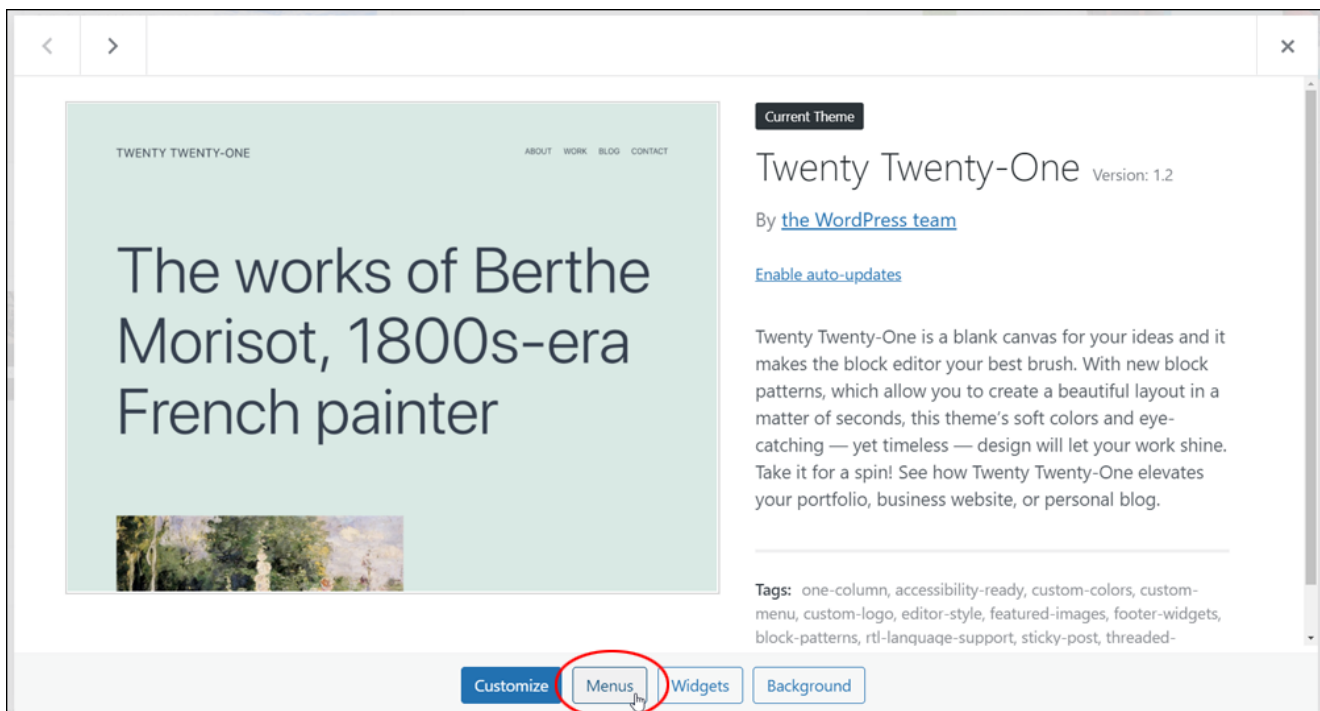

From the main WordPress menu, select Appearance – Menus.

This brings up the **Menus** screen.

The WordPress Menus screen.

You can also access the Menus screen from your theme management area by going to Appearance > Themes, selecting your currently active theme, and clicking on the **Menus** button.

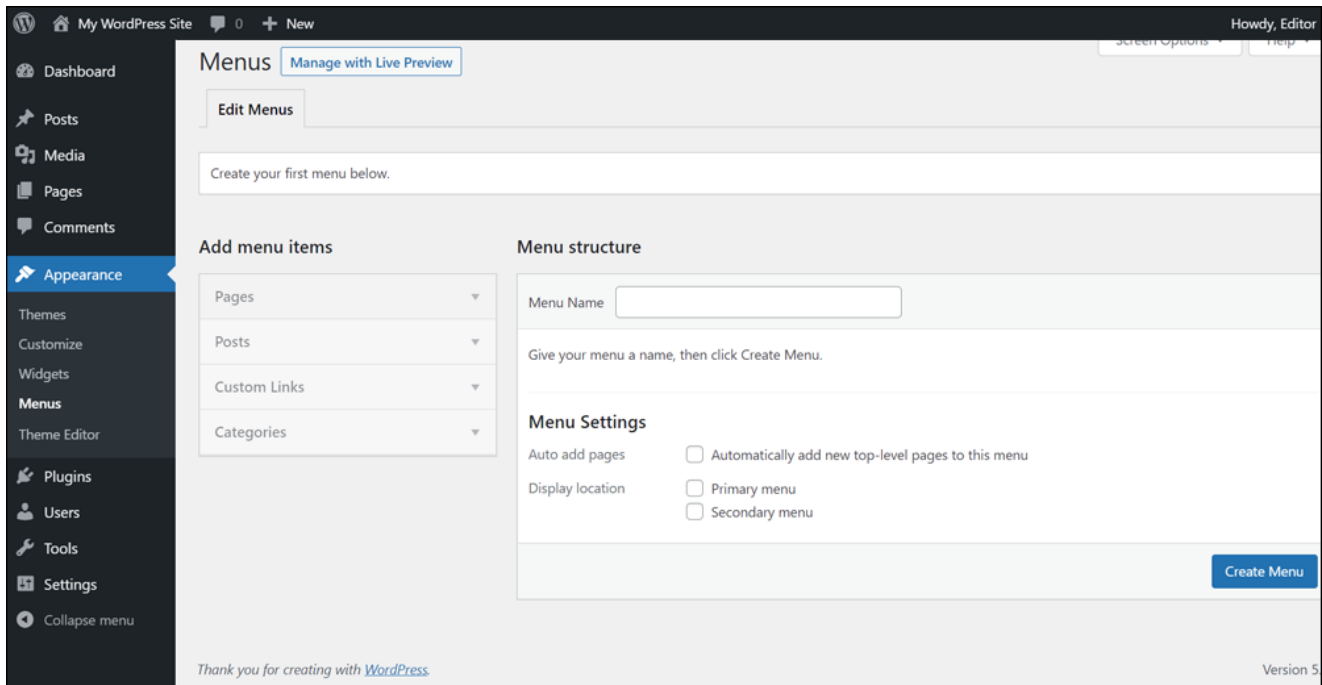

Select your theme and click on the Menus button to go to the Menus screen.

Creating A Menu

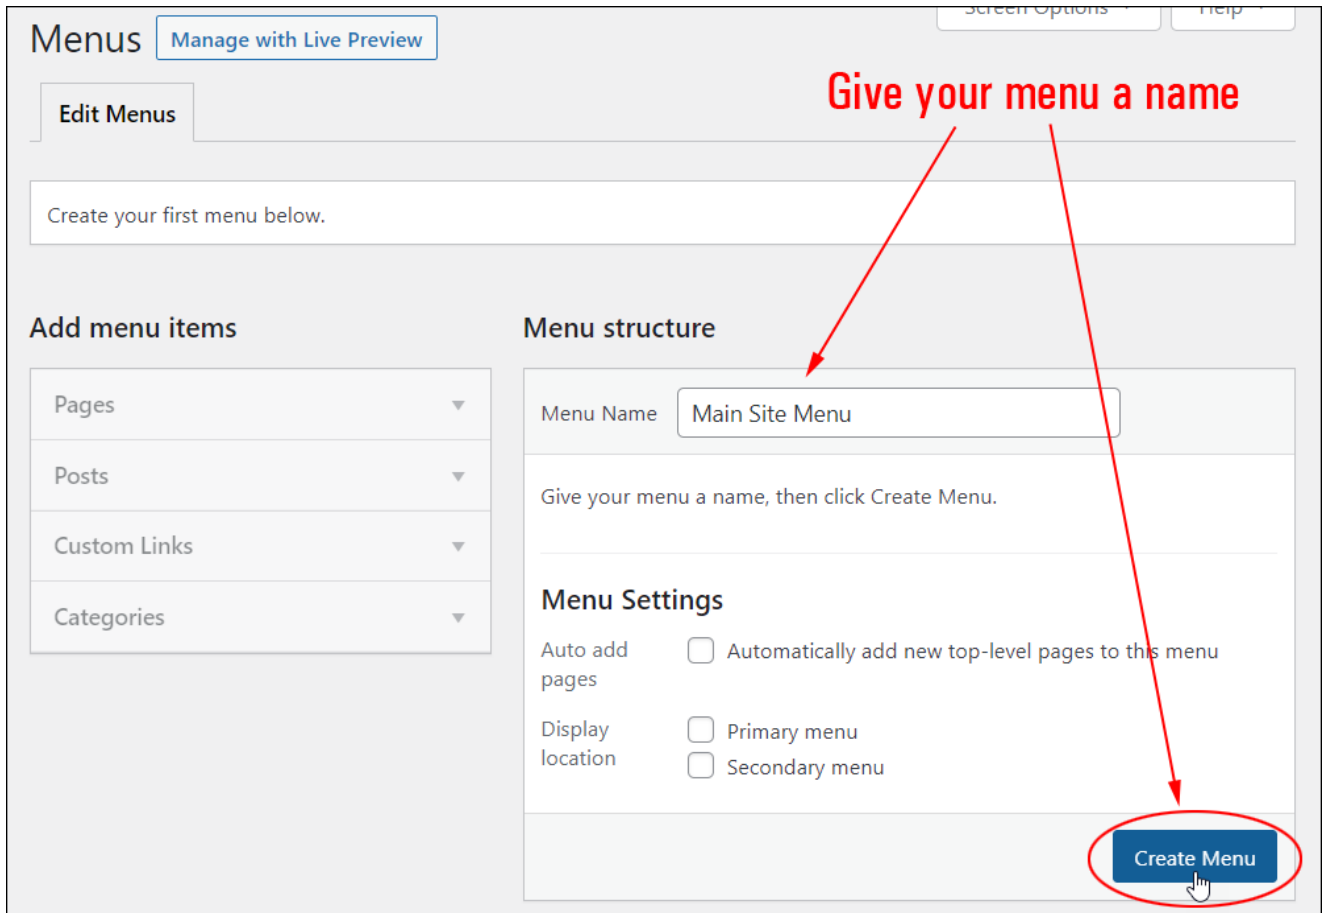

The Menus screen is where you can create multiple menus, customize these with different link types, and add custom navigation menus to different areas of your site.

If no menus have been created yet, the Menus screen will display a blank menu template with a single tab called 'Edit Menus' and a prompt to create your first menu.

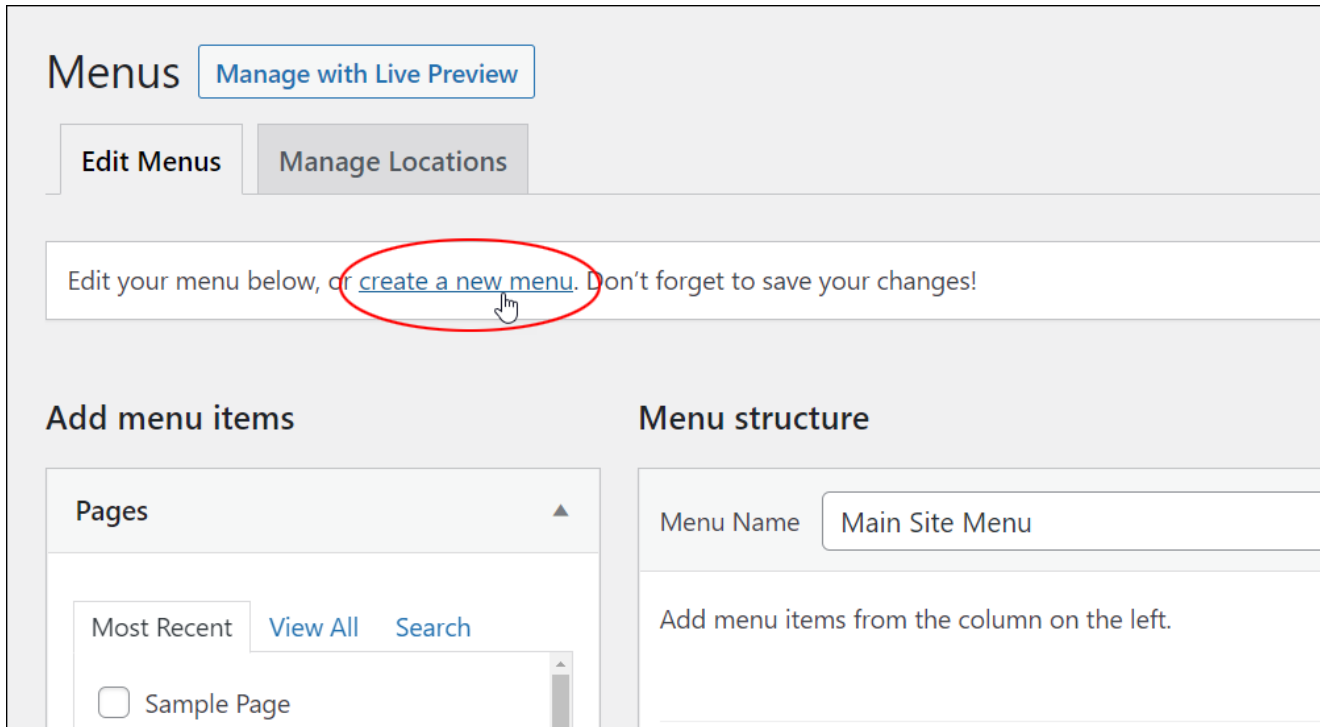

No menus created yet!

To create a new menu, give your menu a name (in the *Edit Menus* tab > *Menu structure* section > *Menu Name* field) and click on the **Create Menu** button.

Give your new menu a name and click on the Create Menu button.

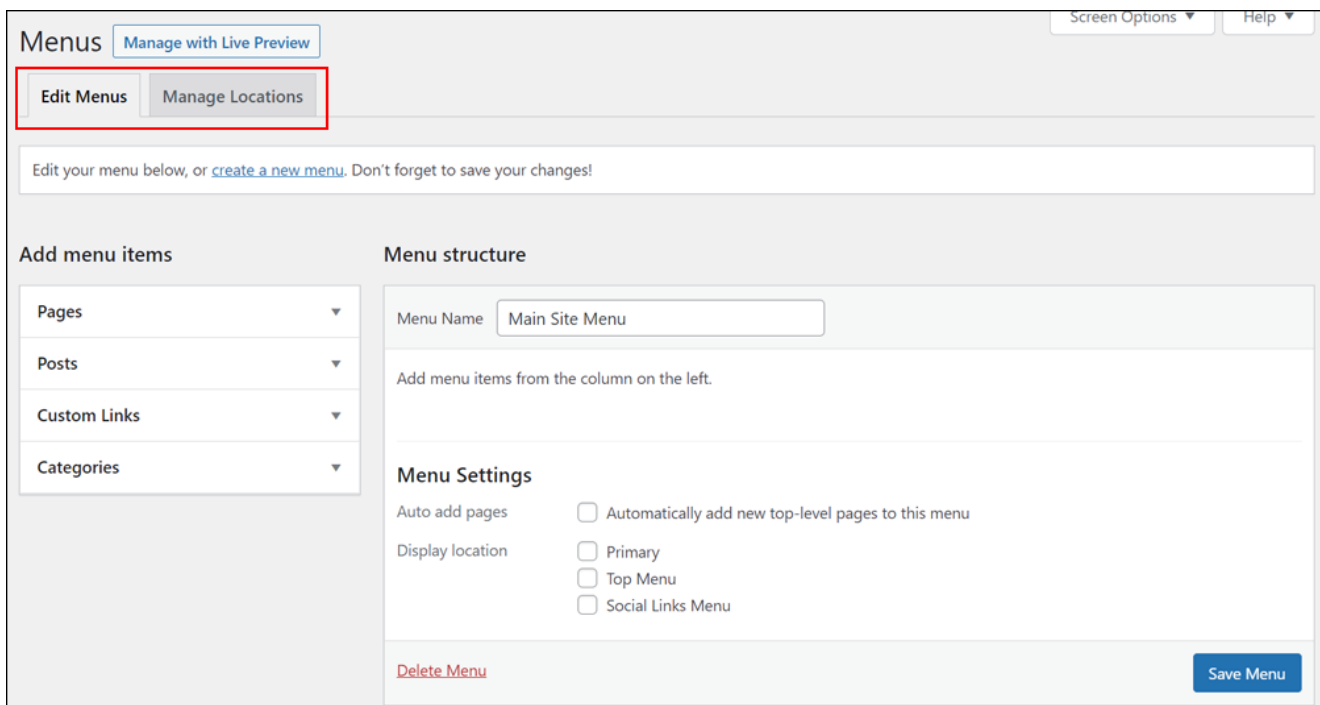

You can also create a new menu by clicking on the 'create a new menu' link below the Menus screen tab as shown below.

Click on the link to create a new menu.

Once the first menu has been created, the Menu screen displays the following tabs:

- Edit Menus
- Manage Locations

Edit Menus and Manage Locations tabs.

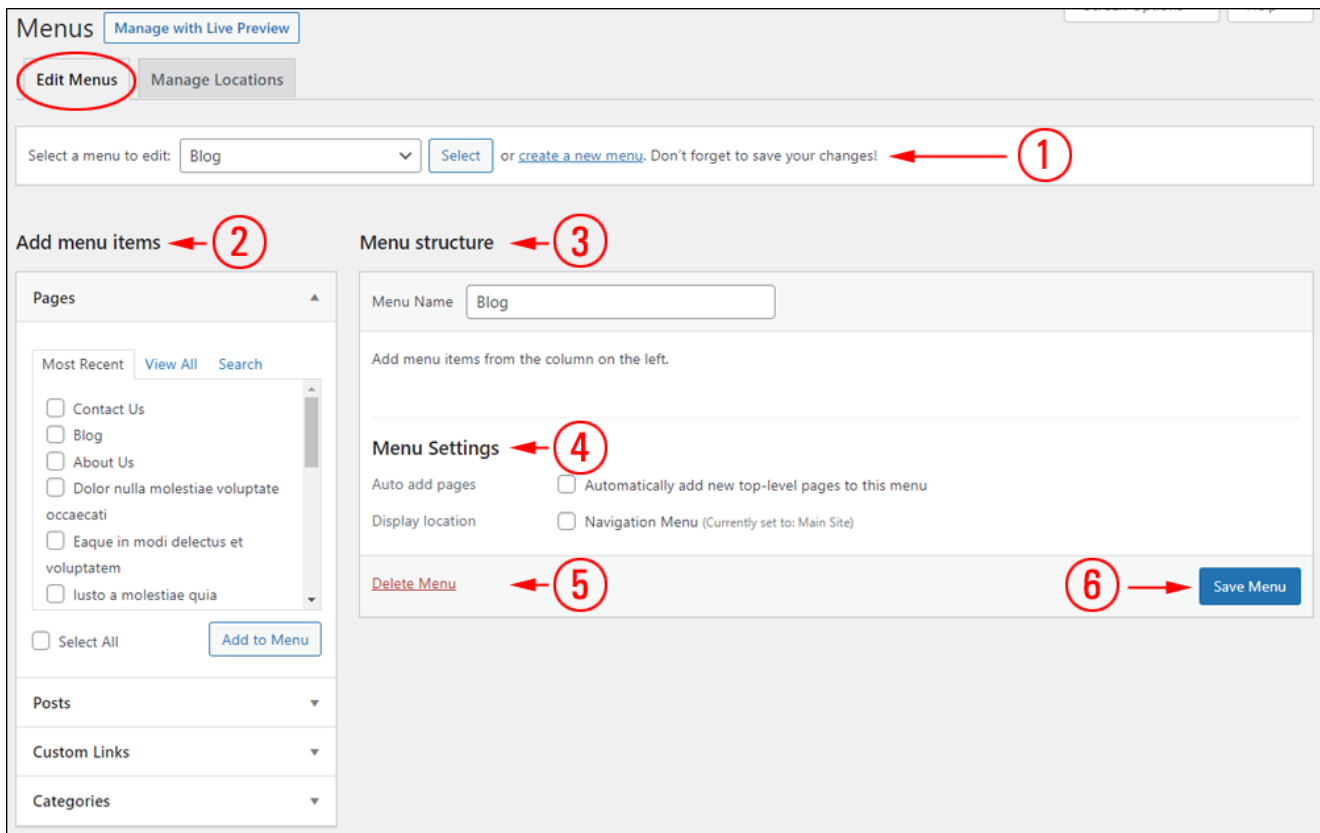

Let's go through each of these tabs.

WordPress Menus – Edit Menu

Navigating the Edit Menus tab

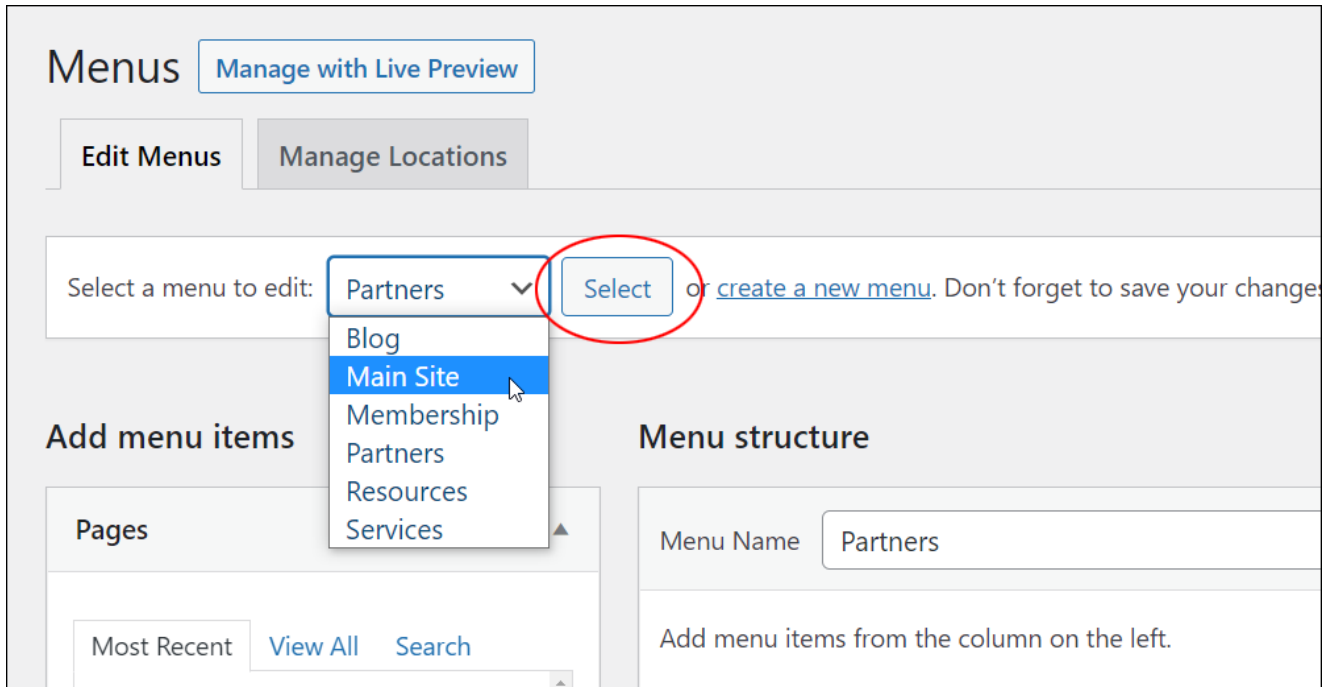

The Edit Menu tab includes the following sections:

1. 'Select a menu to edit' drop-down menu or create a new menu.
2. Add menu items
3. Menu structure
4. Menu Settings
5. Delete menu link
6. Save/Update Menu button

The Edit Menu tab.

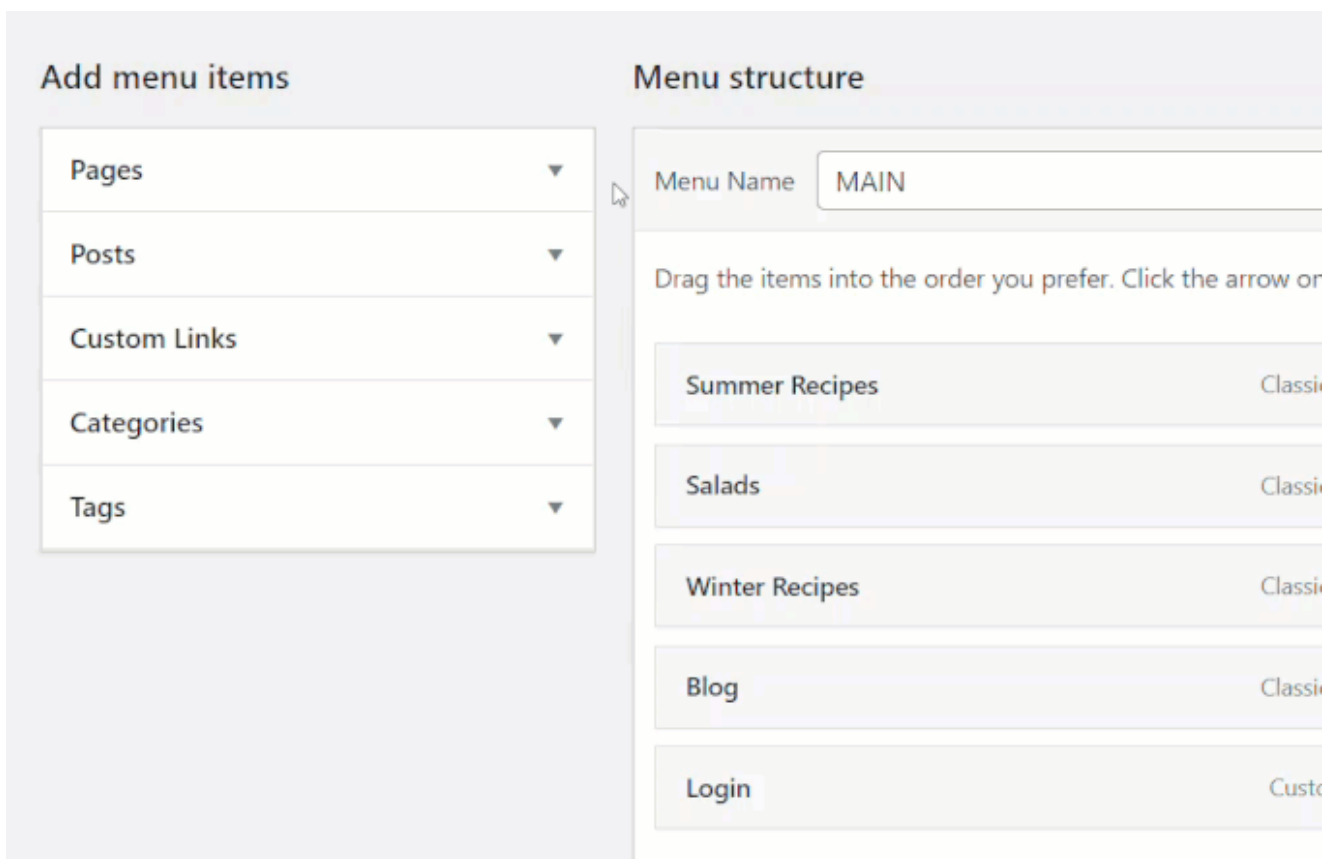

Once you have created a new menu, you can edit it by going to the Edit Menus tab, selecting the menu from the **Select a menu to edit** drop-down menu, and clicking the **Select** button.

Choose a menu from the dropdown and click the Select button to edit it.

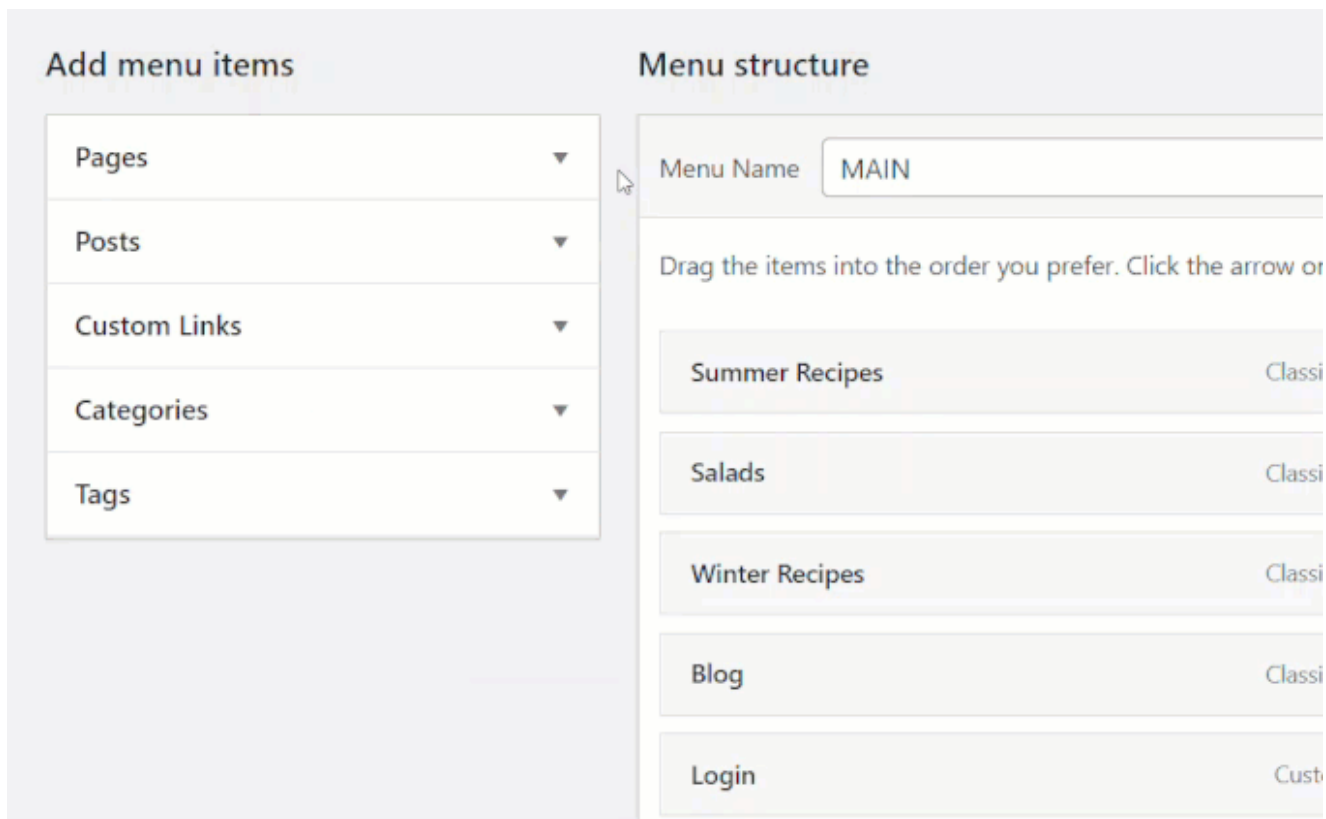

To avoid cluttering your screen, the Menu items and elements on this screen are collapsible.

Click on the little black triangle to expand or collapse items.

Click on the little black triangles to expand and collapse menu items.

Additionally, many items in the WordPress Menu editor include internal features and options like tabs, search and navigation links, and various fields, some of which you can choose to display or hide on your screen.

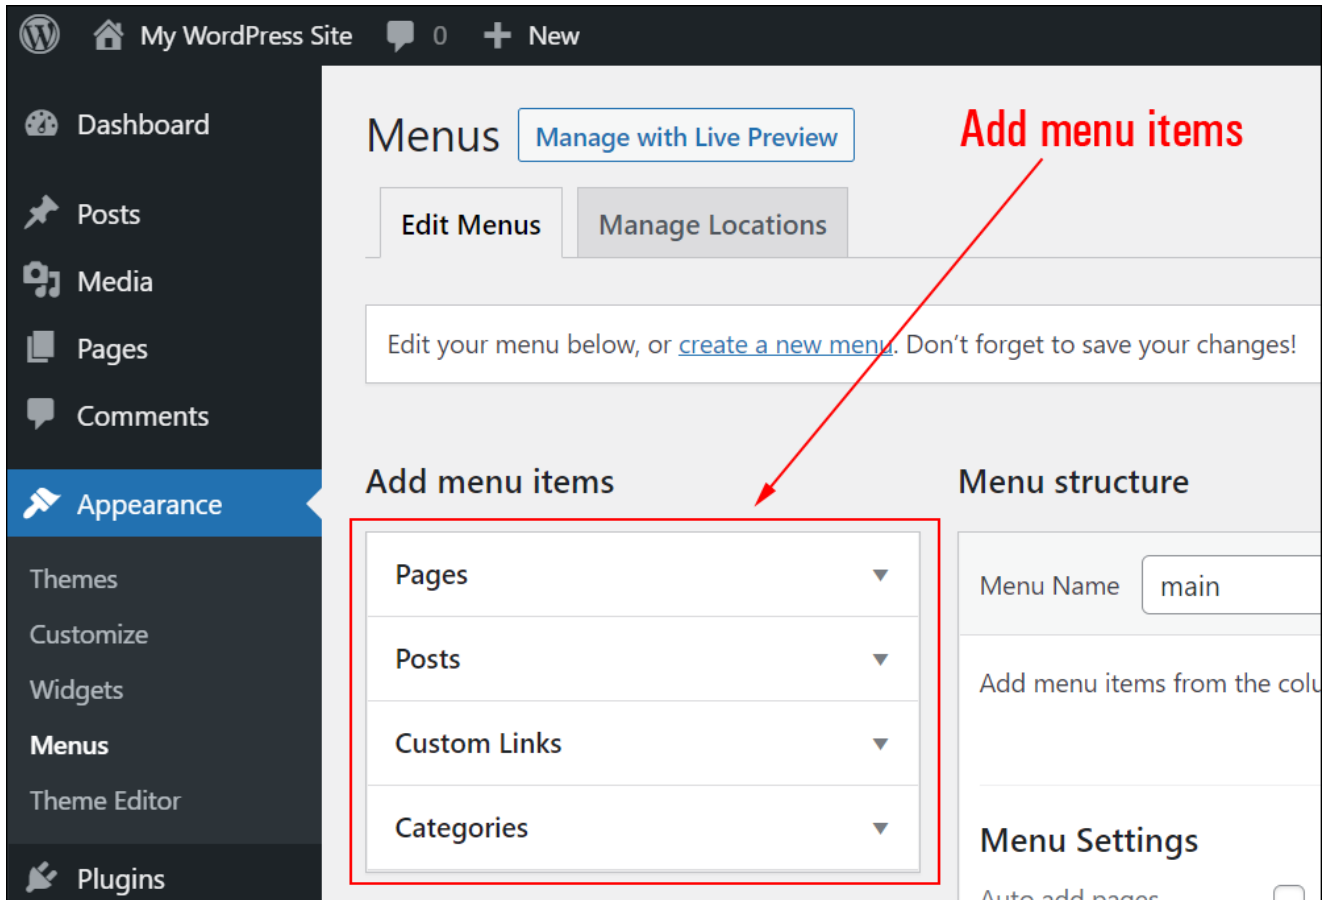

WordPress Menu editor features.

Now that you understand how to navigate the Edit Menus tab, the next step is to add links (e.g. pages, posts, etc.) to your menu.

Adding Menu Items

Some common menu items you can add to your menu(s) include:

- Pages
- Posts
- Custom Links
- Categories
- Tags
- FAQs
- etc.

Add menu items.

Depending on the **theme** and **plugins** installed on your site, you may find additional menu items in this column.

Add different link types to your custom menu.

After adding new item(s) to your menu, remember to click on the **Save Menu** button to save and update your menu settings.

Click the Save Menu button to update your menu settings.

If you don't save your changes, a window will pop up asking you to confirm if you want to leave the page and lose your changes. Click Cancel to stay on the page.

Remember to save your changes before exiting the Menus screen.

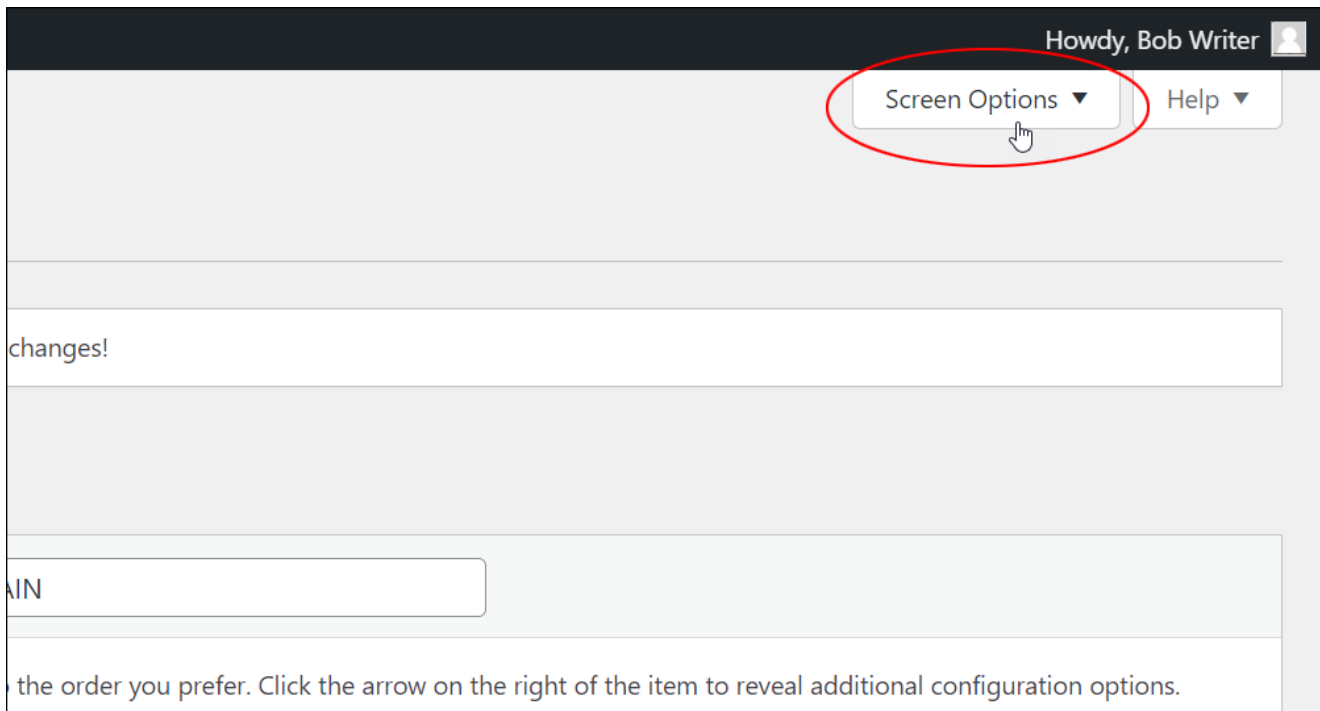

Show/Hide Menu Fields

Some menu elements will NOT display in the Edit Menu section unless you add specific plugins or functions to your site that support custom menu features.

Other elements, however, are initially *hidden* by default.

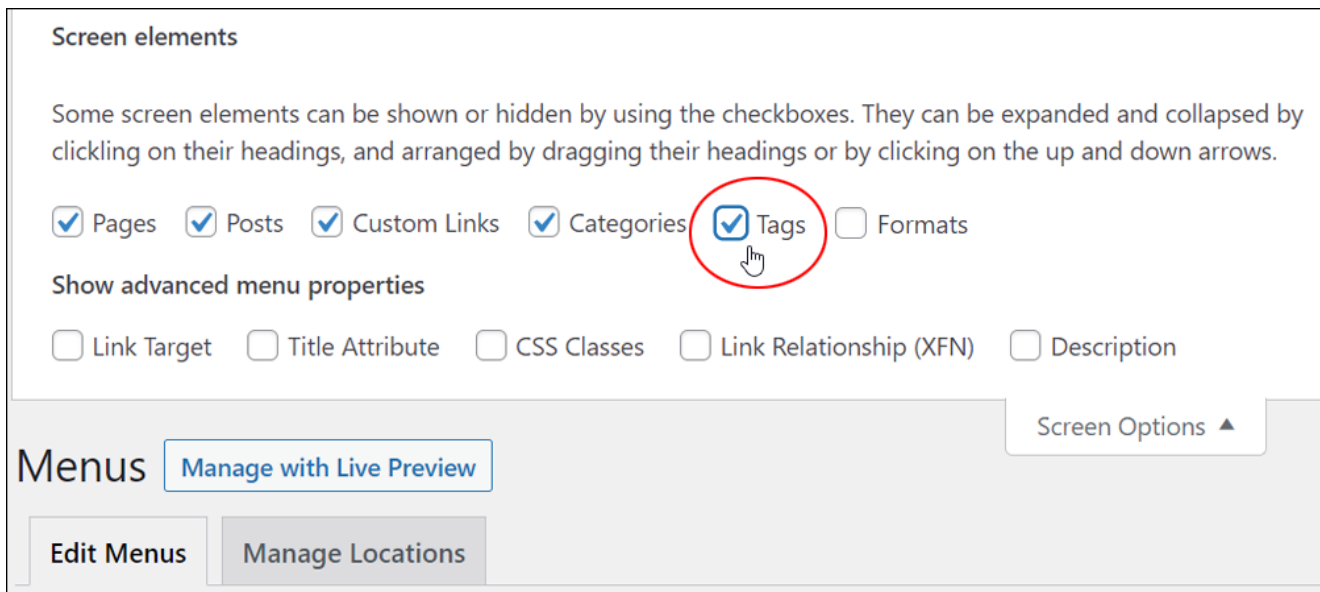

For example, you can add links to posts, and even tag pages to your menus. If you don't see these listed on your menu screen, do the following to display these:

Scroll to the top right-hand corner of your Edit Menu screen and click on the **Screen Options** tab.

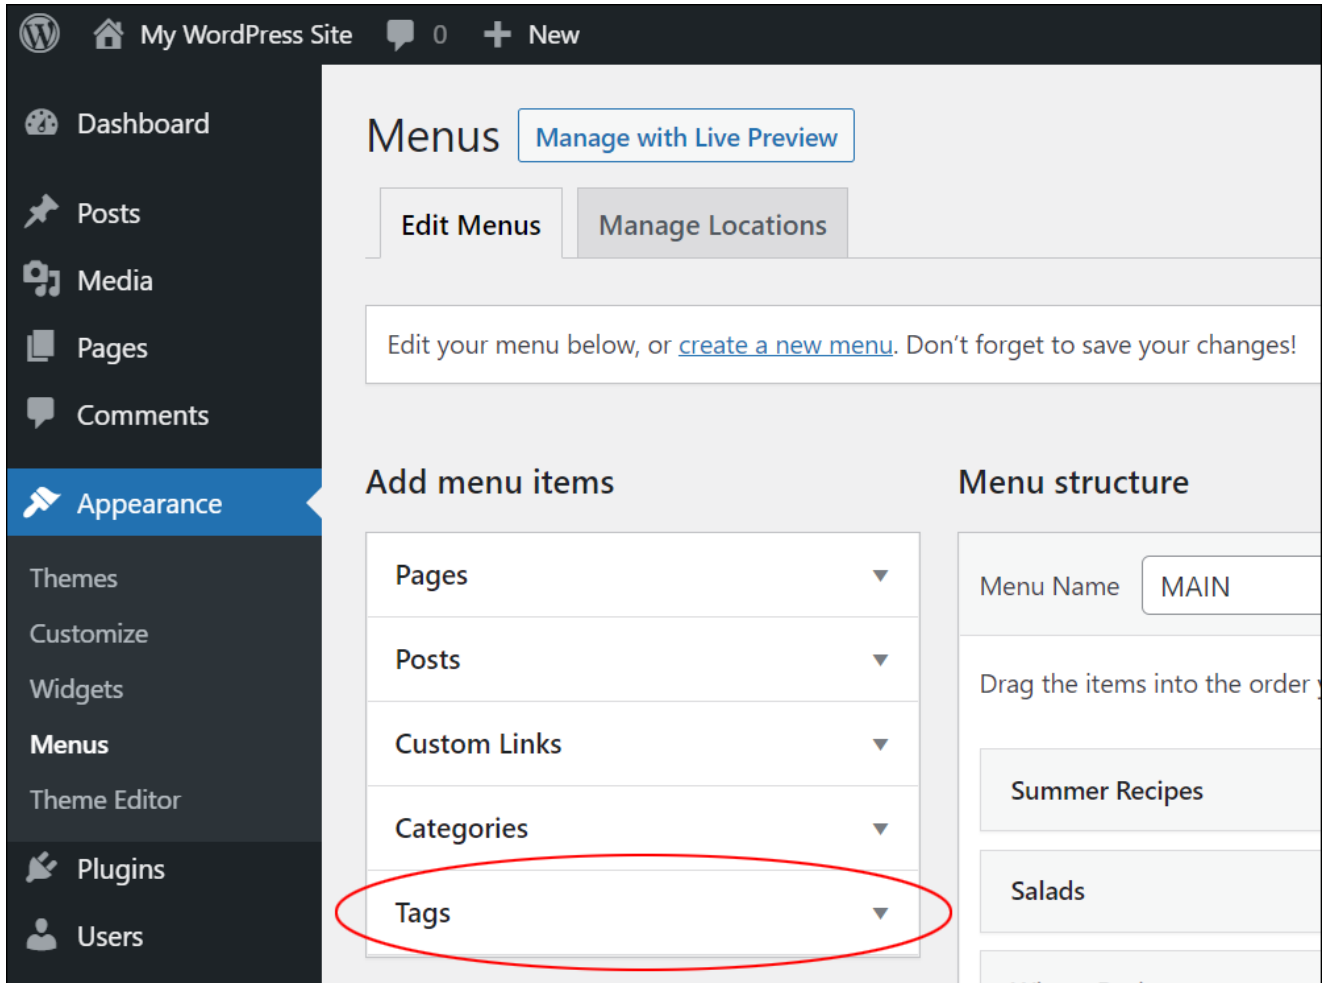

Click the Screen Options tab to view additional Menu Screen options.

In the **Screen elements** section, tick the checkboxes next to any elements that you would like to display.

Show or hide screen elements by enabling or disabling checkboxes.

The item will now appear on the **Add menu items** section.

Display menu items like tags on your Menus screen by enabling the option in the Screen Options tab.

In the **Add menu items** section of certain link types (e.g. Pages and Posts), you can choose to view only your most recent items, view all items, or search for specific items (just type a word into the search field and WordPress will automatically search and return matching results).

Use the Search tab to quickly find menu items like Posts and Pages.

With other link types (e.g. categories and tags), you will see slightly different options (e.g. Most Used).

The screenshot displays a user interface for managing a menu. It is divided into two main sections: 'Add menu items' on the left and 'Menu structure' on the right.

Add menu items: This section contains a list of categories: Pages, Posts, Custom Links, and Categories. Below these is a 'Most Used' tab, which is highlighted with a red box. To its right are 'View All' and 'Search' links. A scrollable list of items follows, each with an unchecked checkbox: Shipping, Sales, Marketing, Clients, Training, Operations, Management, and Finance. At the bottom of this list are a 'Select All' checkbox and an 'Add to Menu' button.

Menu structure: This section shows the menu name as 'Blog'. Below this is a drag-and-drop area with the instruction: 'Drag the items into the order you prefer. Click the arrow on the right side of the item to move it.' The items currently in the menu are: About Us, Free Report, Videos, and Training. Below the menu items is the 'Menu Settings' section, which includes two options: 'Auto add pages' (with an unchecked checkbox and the text 'Automatically add new top-level pages') and 'Display location' (with an unchecked checkbox and the text 'Navigation Menu (Currently selected)'). At the bottom of the 'Menu structure' section is a 'Delete Menu' link.

Menu item panels like categories and tags display Most Used tabs.

Some items have no additional inline options (e.g. Custom Links).

Custom link menu item.

Note too that if you're using a single editor only (e.g. the Block editor), menus simply display their link type (e.g. *Post* or *Page*).

The screenshot shows the 'Menu structure' editor in WordPress. At the top, there is a 'Menu Name' field containing 'Main Site'. Below this, a instruction reads: 'Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration'. The menu items are listed in a vertical stack: 'Home', 'About Us', 'Blog', and 'Contact Us'. To the right of each item is a dropdown menu showing the link type: 'Post' for 'Home', and 'Page' for 'About Us', 'Blog', and 'Contact Us'. A red rectangular box highlights the dropdown menus for 'Home', 'About Us', 'Blog', and 'Contact Us'.

The WordPress menu editor lets you quickly see which links on your menus are Posts or Pages.

If, however, you are using both the WordPress classic editor and the block editor to create posts and pages, WordPress will tag these in the menu item descriptors.

The menu editor also lets you view menu items created using the WordPress block or classic editors.

Editing Menu Items

After adding items to your menu, you can further modify and customize these.

Expand Or Collapse Menu Items

As mentioned earlier, you can expand or collapse a menu item by clicking on the little triangle on the right-hand corner of the title bar.

Click the triangle icon to view additional settings for your menu items.

Open Navigation Menu Links In A New Browser Tab

Opening navigation menu links in a new browser tab means allows visitors to stay on the page after closing the tab.

By default, WordPress hides the option to open navigation menu links in a new tab to prevent cluttering up your menu item panel.

If you want a menu item to open on a new tab when visitors click on the menu link, do the following:

First, expand the menu item.

Menu structure

Menu Name

Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration options.

Remember to save your changes when done to update your menu settings.

Advanced Menu Properties

Advanced menu properties are mostly used by web developers and WordPress theme designers to further enhance, style, and customize menu options.

Your theme must support advanced menu properties for these options to work.

The screenshot below shows an item with all the advanced options displayed (you can enable these options in the Screen Options tab):

1. Title Attribute
2. CSS Classes (optional)
3. Link Relationship (XFN)
4. Description

Advanced menu properties.

Let's take a brief look at each of these properties.

Title Attribute: This field specifies the Alternative ('Alt') text for the menu item. This text displays when a visitor hovers over a menu item.

For example, if you add the following line into the *Title Attribute* field and then save your menu...

Menu structure

Menu Name

Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration options.

Title Attribute

Open link in a new tab

CSS Classes (optional) Link Relationship (XFN)

Description

Let's add a title attribute to this menu item.

Here is what your visitors will see if they hover over the menu link...

The title attribute displays like a tooltip when visitors hover over menu items.

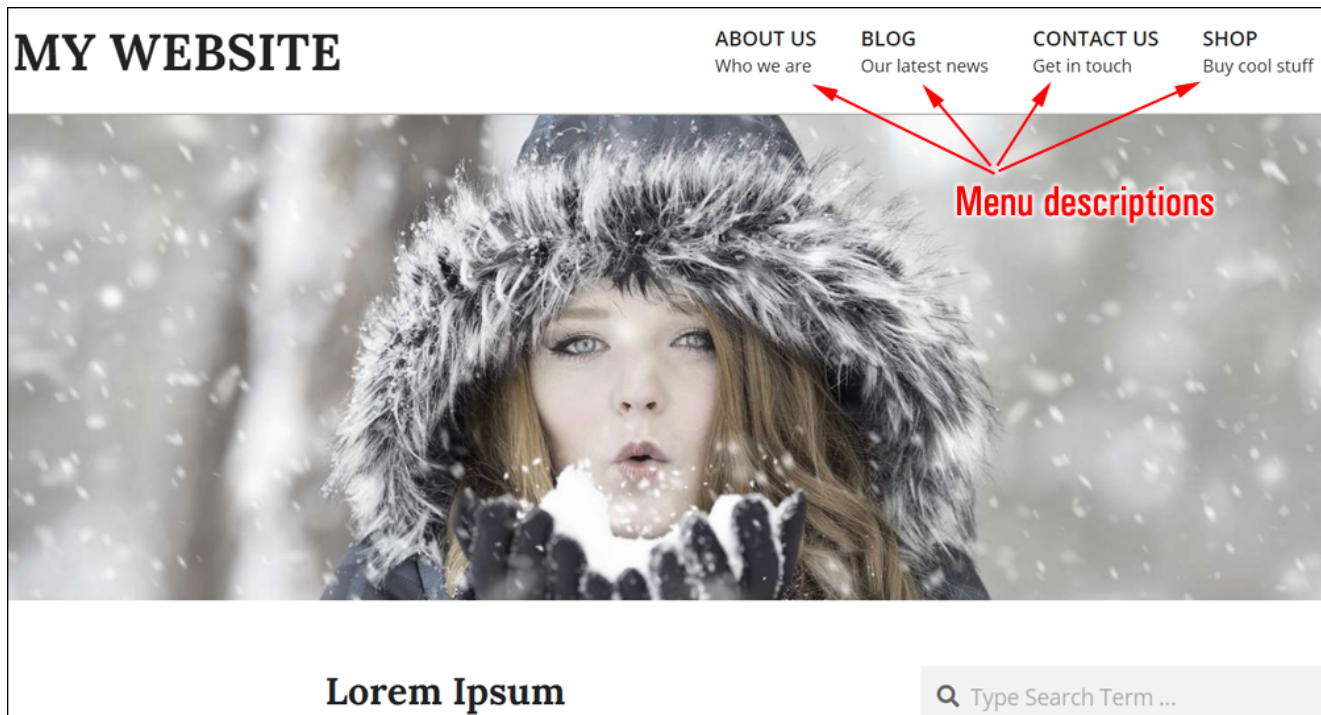

CSS Classes: This allows you to style your links using **CSS** (Cascading Style Sheets). After adding a CSS class to a menu link, you can then target the classes you have assigned from within your stylesheet. Note: This requires knowledge of CSS.

Link relationship (XFN): XFN (XHTML Friends Network) is a simple way to represent the relationships you share with the owners or authors of other websites using links.

This allows certain programs such as search engines and specialized services to understand and display the relationships you share with other people, such as friends, professional contacts, etc.

For more information, go here: [XFN](#)

Description: This field can be used to add a short description to a menu label.

Adding short menu descriptions can help users understand your menu items better.

You can also give your menu label a custom name that is different from the name of your original page name.

Menu structure

Menu Name

Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration options.

[Delete Menu](#)

Make sure to add some items to your menus.

After adding menu items, notice that “Move” options will display in your item’s details section, allowing you to move the position of your item on the menu bar relative to other menu items (e.g. move up, move down, move to the top, nest under the item shown above, etc.).

The screenshot shows a configuration panel for a menu item named 'Blog'. At the top, the item name 'Blog' is displayed on the left and 'Page' with an upward arrow on the right. Below this is a 'Navigation Label' section containing a text input field with 'Blog' inside. Underneath the input field is a checkbox labeled 'Open link in a new tab' which is currently unchecked. A red rectangular box highlights a row of four blue, underlined links: 'Move', 'Up one', 'Down one', and 'Under Our Story'. Below these links is another text input field containing 'Original: Blog'. At the bottom of the configuration section are two links: 'Remove' in red and 'Cancel' in blue. Below the configuration panel, two other menu items are visible: 'Contact Us' and 'Shop', each with 'Page' and a downward arrow to its right.

Click on the links to reposition items on your menus.

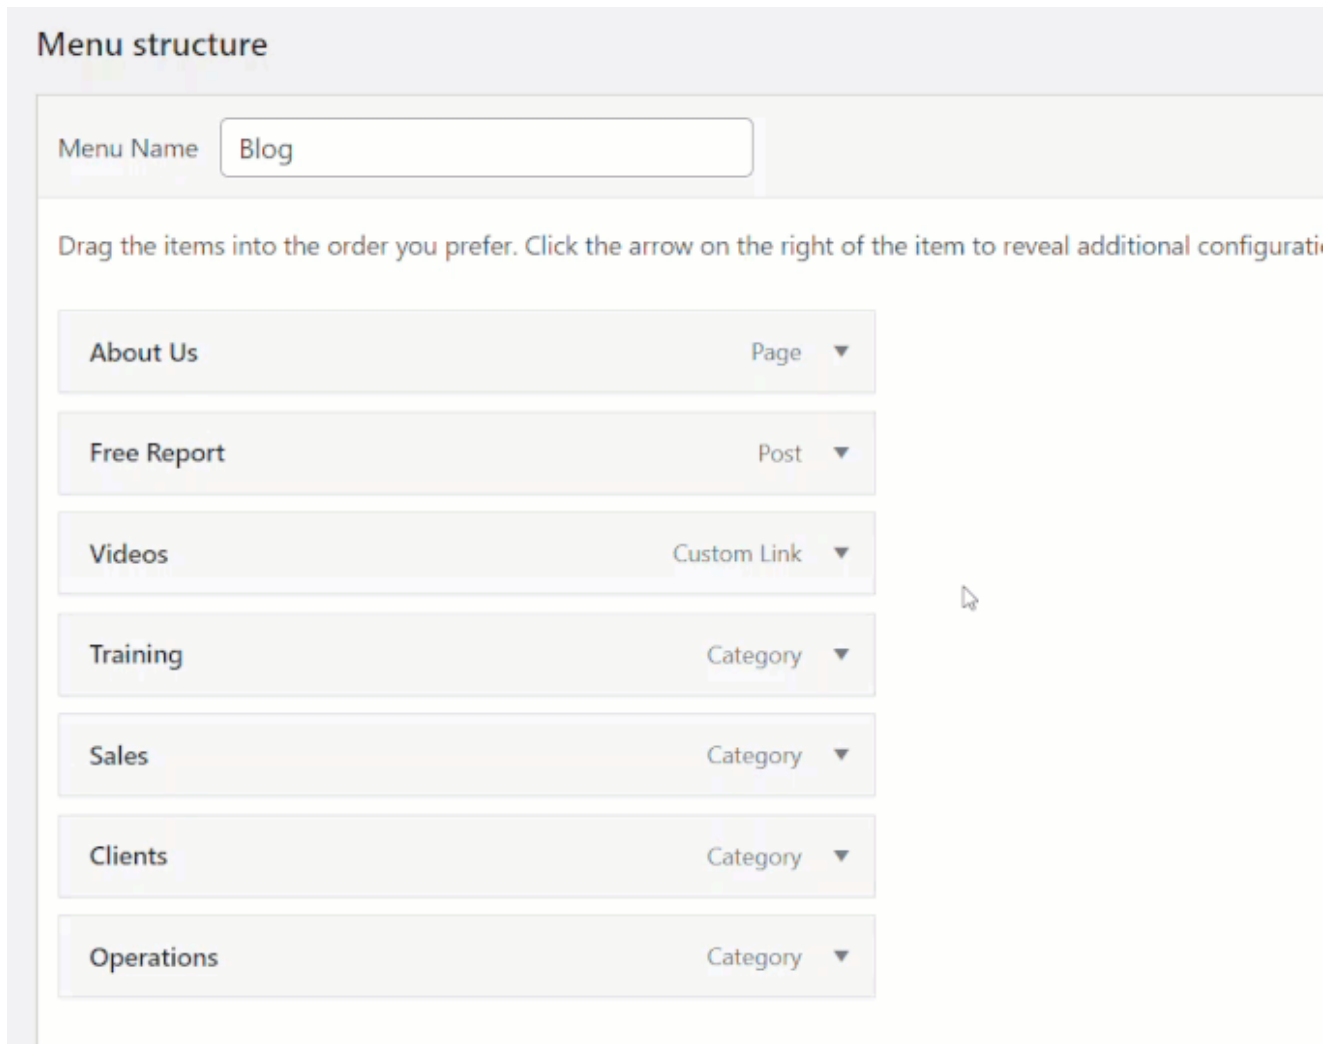

To rearrange your menu items, you can either click on a “Move” option or click the title bar of an item, hold, then drag and drop it into another position.

Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration

The screenshot shows a menu configuration interface. At the top, there is a header: "Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration". Below this, there are several menu items in a list. The first item is "Blog" with a "Page" dropdown arrow pointing down. The second item is "Our Story" with a "Page" dropdown arrow pointing up. Below "Our Story", there is a "Navigation Label" field containing "Our Story", a checked checkbox for "Open link in a new tab", and a row of four links: "Move Up one", "Down one", "Under Blog", and "To the top". These four links are enclosed in a red rectangular box. Below the links is a field for "Original:" containing "About Us", and two buttons: "Remove" and "Cancel". The third item in the list is "Shop" with a "Page" dropdown arrow pointing down. A "Contact Us" item is being dragged from below the "Shop" item. It has a four-way arrow icon next to it and a "Page" dropdown arrow pointing down. A red arrow points from the text "Use these to rearrange the order of menu items" to the red box containing the move links.

Clicking on the Move links or use drag and drop to reorder your menu items

You can use a combination of both methods to get your menu items ordered exactly how you would like them to display.

Reorder menu items quickly using Move links and drag and drop.

How you order menu items in the menu editor is how your visitors will see them.

For example, here is a screenshot of a menu placed below the theme header, with items displayed in a certain order...

Let's reorder these menu links...

If we now rearrange the order of menu items to look like this...

A screenshot of a 'Menu structure' editor interface. The title 'Menu structure' is at the top left. Below it, there is a 'Menu Name' field containing 'Main Site'. A descriptive text reads: 'Drag the items into the order you prefer. Click the arrow on the right of the item to reveal additional configuration'. The menu items are listed in a vertical stack, each in a light grey box. From top to bottom, they are: 'Free Report' (with a 'Post' dropdown and a drag handle icon), 'About Us' (with a 'Page' dropdown), 'Contact Us' (with a 'Page' dropdown), 'Shop' (with a 'Page' dropdown), and 'Blog' (with a 'Page' dropdown). A red arrow points from the text 'Drag and drop to reorder menu' to the 'Free Report' item.

Drag and drop items to reorder this menu.

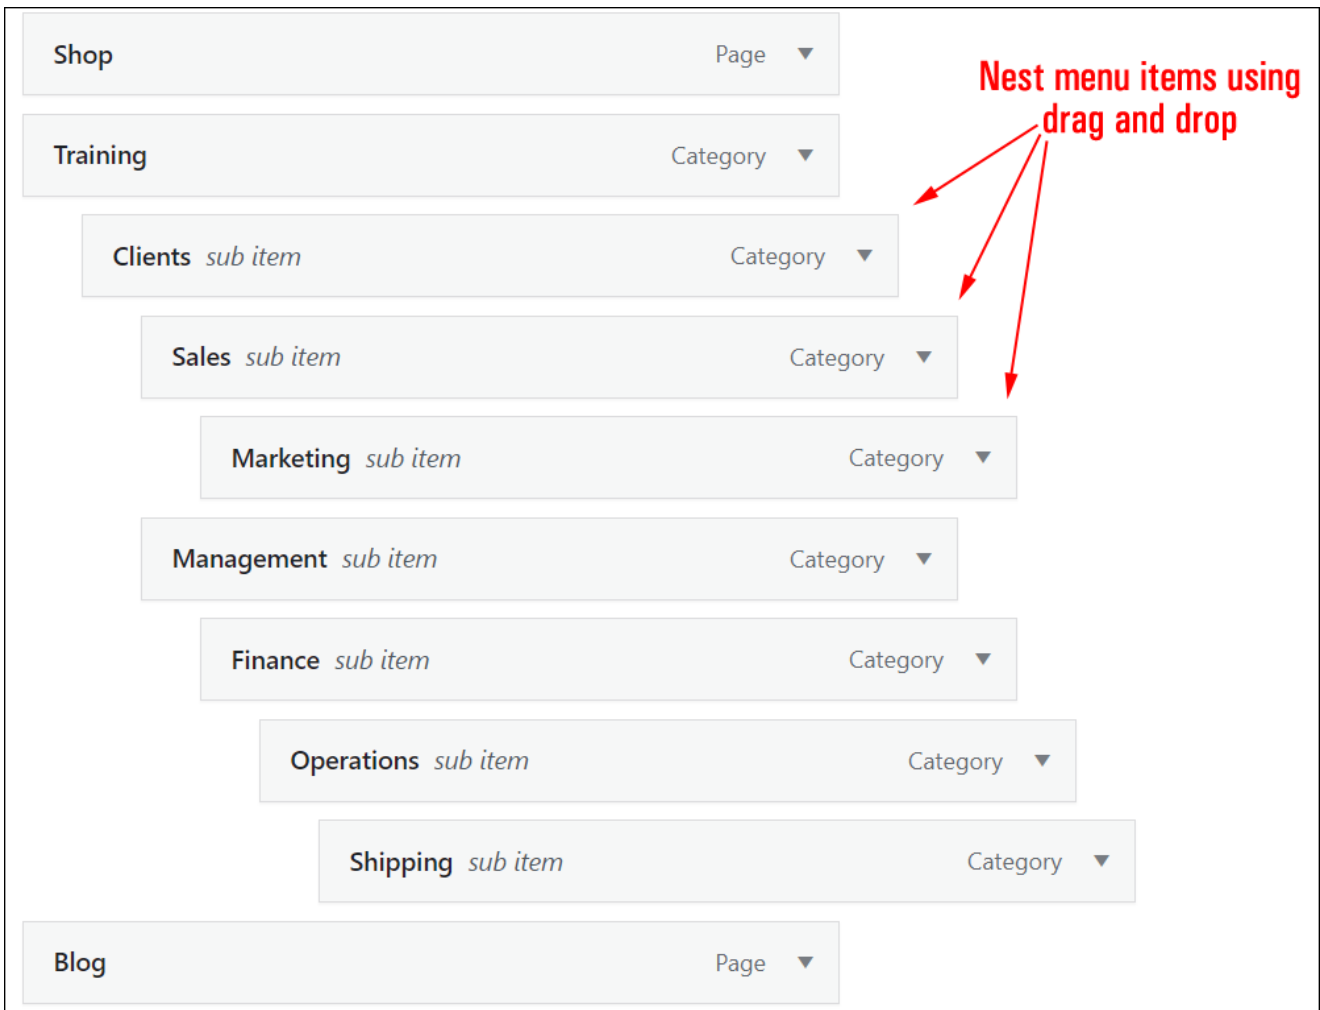

The reordered menu links will automatically display to visitors as you have arranged them in the menu editor.

Reordered menu links.

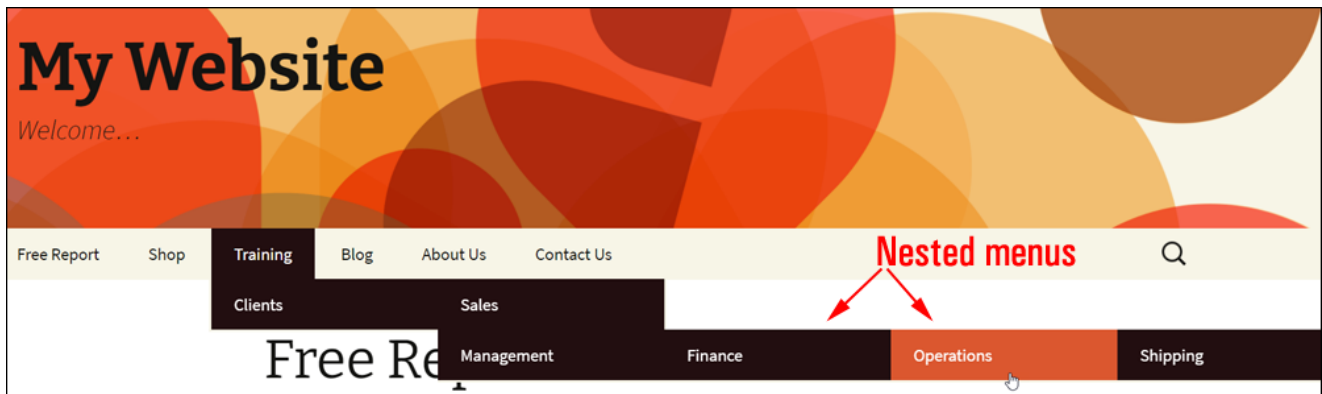

You can also create nested menus using drag-and-drop by shifting their position away from the left margin.

You can nest menu items multiple levels deep.

Nest menu items using drag and drop.

Here is an example of the resulting nested menu configuration created in the previous screenshot.

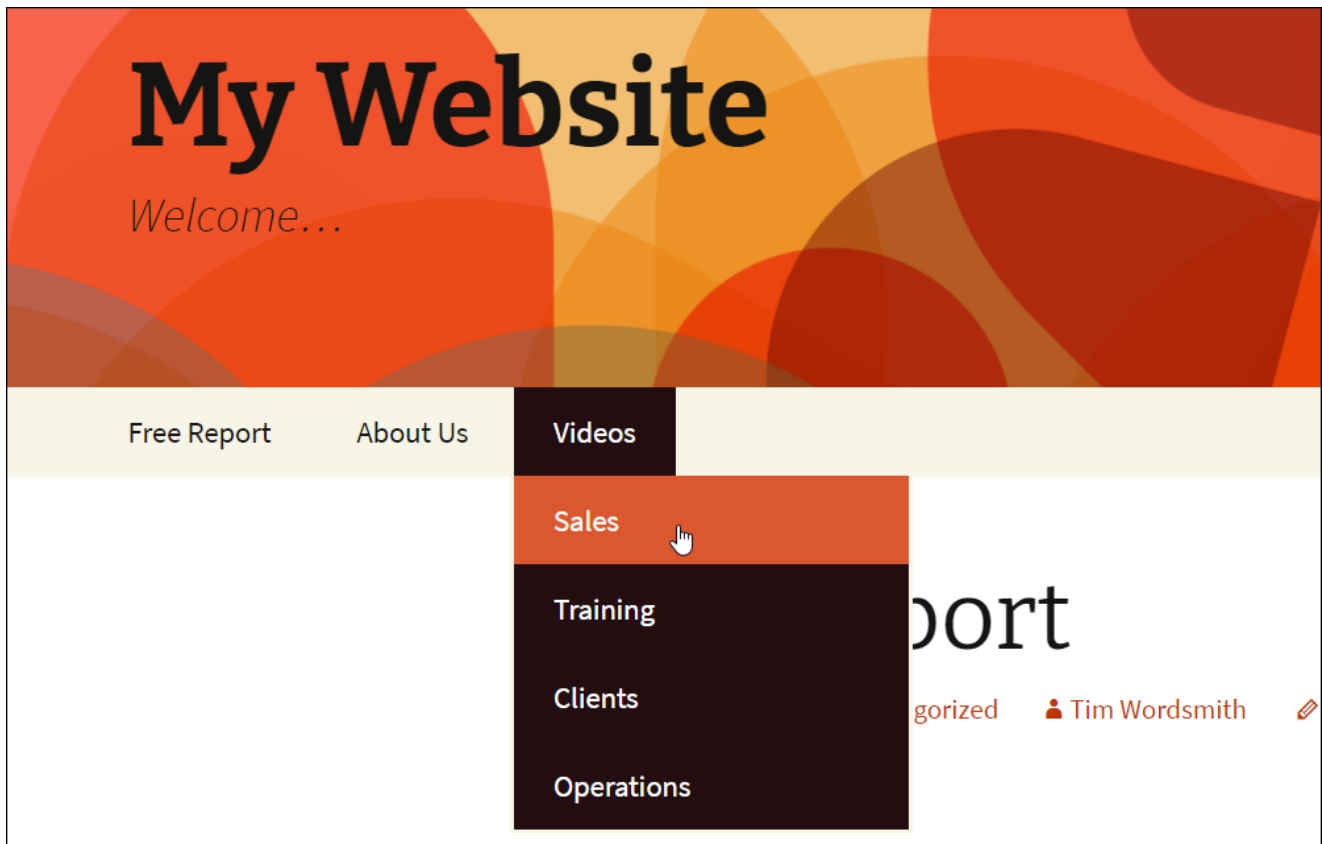

WordPress lets you create deeply nested menus.

Note: menu styles are controlled by the styling options in your theme and will display differently depending on the WordPress theme installed on your site.

Here are some examples of using different themes with the same menu:

Example #1...

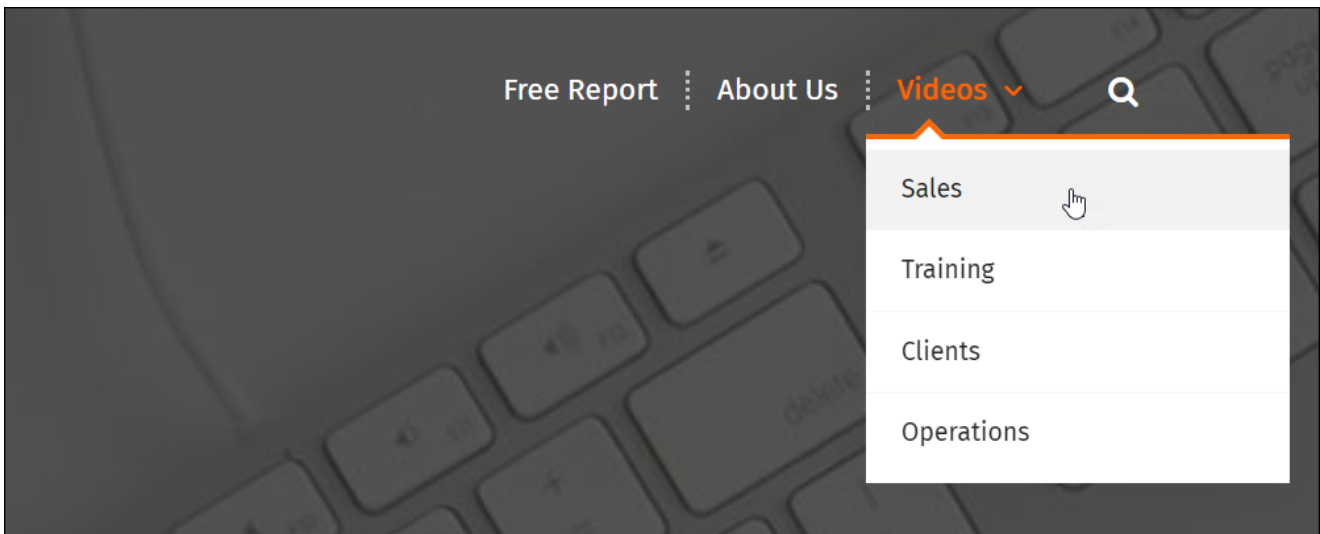

WordPress Theme – Twenty Thirteen.

Example #2...

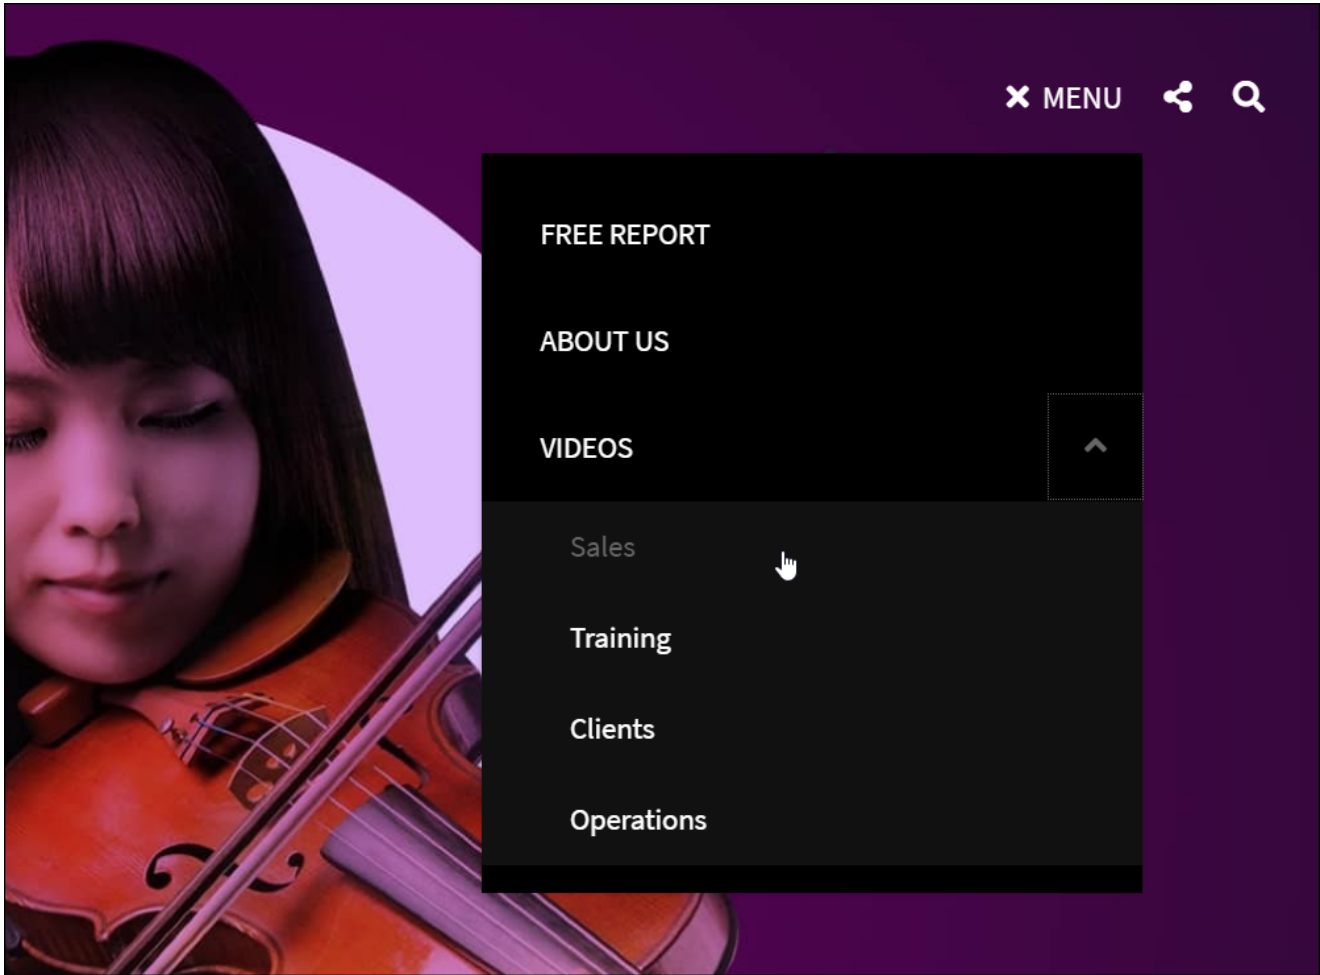

WordPress Theme – Twenty Twenty-One.

Example #3...

WordPress Theme – Avril.

Example #4...

WordPress Theme – [Zubin Music](#).

If you need help finding themes for your site, see this tutorial: [Where To Find WordPress Themes](#)

Menu Settings

The Menu Settings section lets you automatically add pages to menus depending on the options you choose:

- **Auto Add Pages:** *Automatically add new top-level pages to this menu.* When you check this box, every new page you create on your site will be automatically added to the selected menu. *Note:* Use this option with caution because your menu will change if you use this feature.
- **Display location:** Enable or disable the locations where you would like the selected menu to appear on your site. Options displayed in this section depend on your currently active theme.

Menu Settings

- Display location Primary
 Top Menu
 Social Links Menu

Configure menu settings in the Edit Menu section.

Most WordPress themes support custom menus.

- If your current theme supports custom menus, you will be able to add your new menu to one of the Display locations.
- If your current theme does not support custom menus, you will need to add your new menu via the **Custom Menu widget**.

Manage Locations

For menus to display on your site, you will need to assign your menus to a location on your theme (e.g. header, footer, sidebar, etc.).

Some WordPress themes provide only one menu location, even if you have created multiple custom menus.

Your menu has been successfully deleted.

Manage With Live Preview

Use the **Manage with Live Preview** feature to view any changes made to your menus before permanently saving these.

Click the Manage with Live Preview button to view your changes without saving and making them live.

This will bring up the Theme Customizer screen and Live Preview feature.

Preview your menu changes in the Theme Customizer screen.

If you need help using this feature, see this tutorial: [**How To Use The WordPress Theme Customizer**](#)

Using Custom Menus With Widgets

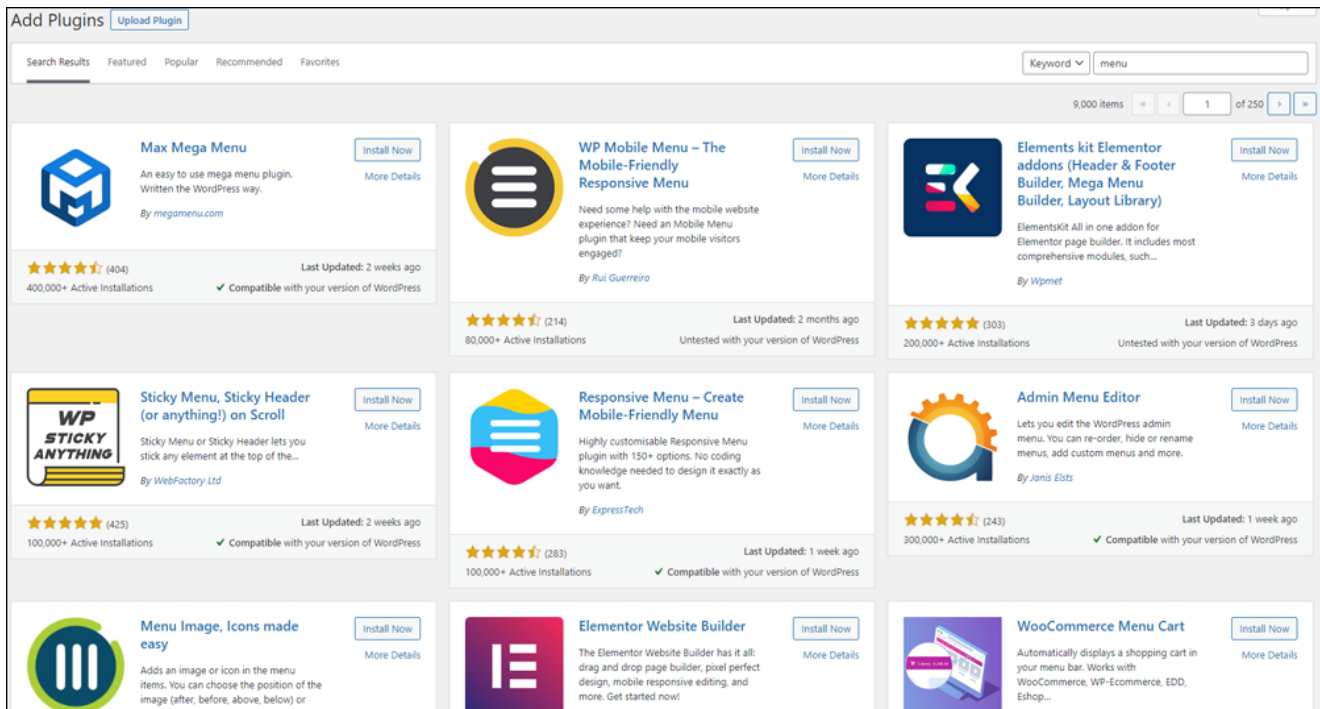

Custom menus can be added to your sidebar and other menu locations using widgets.

To learn how to add menus to your site using widgets, see this tutorial: [**How To Use Widgets – Part 3**](#)

Additional Information

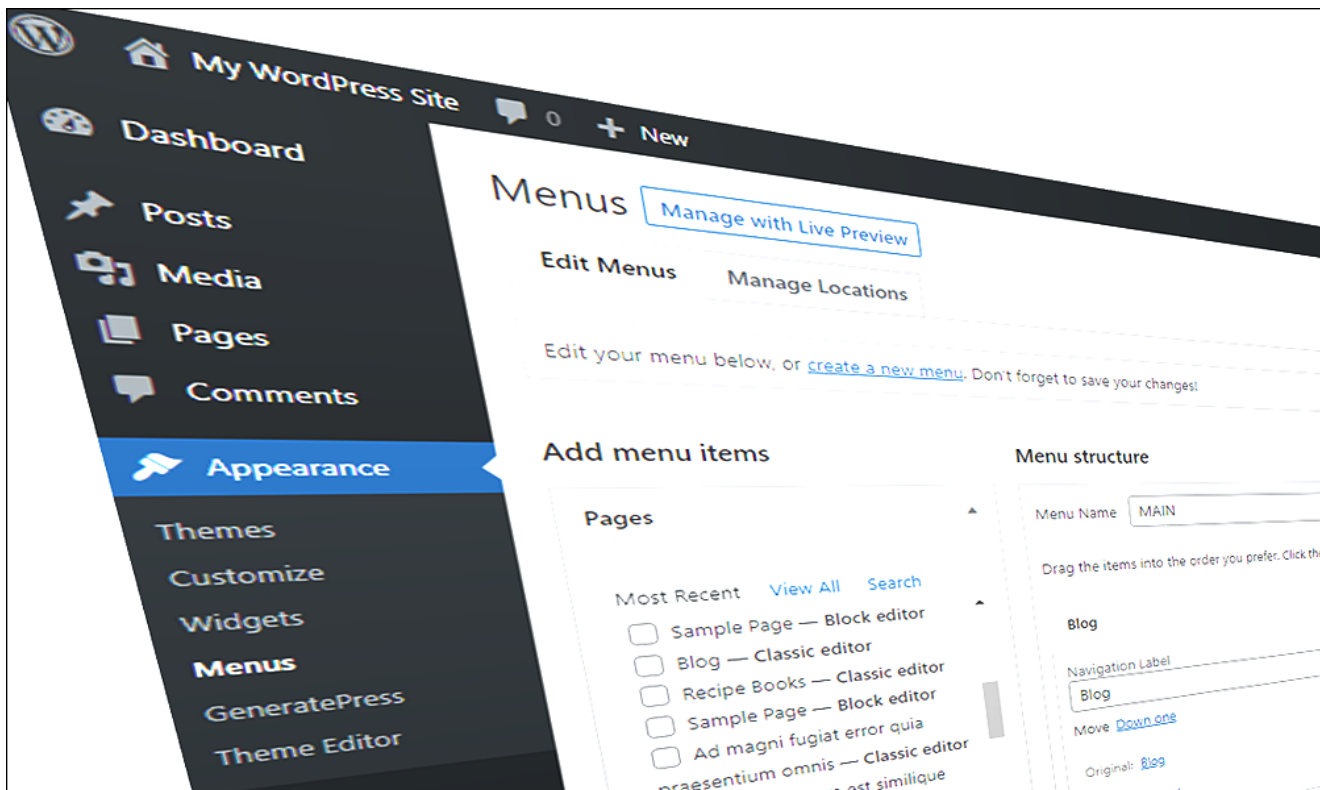

There are many plugins you can use to enhance your WordPress menus.

You can search for WordPress menu plugins inside your WordPress dashboard (**Plugins > Add New**), or the WordPress Free Plugin Directory.

Search the WordPress directory for thousands of menu-enhancing plugins.

Congratulations! Now you know how to create and use custom navigation menus in WordPress.

Add custom navigation menus to your WordPress site.
