#### **WordPress Editors**

WordPress provides users with not one but two content editors!

Yes, you heard me right...two different content editors.

Why two content editors, you ask?

Great question!

The best way to explain and understand this is to go back a little in time and talk briefly about the <u>history of WordPress</u> itself.

WordPress has been around since 2003. It started as a French programmer's coding project to create blog pages from content stored on a database. This project got abandoned but was picked up by a couple of users called Mike Little and Matt Mullenweg who wanted to develop it further.

Mike and Matt also wanted to make WordPress into a platform that operates with minimal core software and to make the code freely available, so anyone could build and add anything they wanted to it.

What makes WordPress so powerful, then, is that you can literally do and build almost anything you can imagine with it.

Fast forward to today, and WordPress is now the world's leading Content Management System (CMS), powering over a third of the world's self-hosted CMS websites.

As WordPress grew in popularity worldwide, however, programmers and web developers working with the software realized that a lot of its basic components would not be ideal for WordPress to keep growing indefinitely as an online publishing platform.

So, around 2017, Matt Mullenweg announced that WordPress was redefining itself to allow for future growth and indefinite expansion and that the platform would gradually (and eventually) move over to a completely different architecture altogether.

This new architecture was named 'Gutenberg' (after Johannes Gutenberg, the inventor of the mechanical printing press).

Gutenberg is based on using "blocks." Different 'blocks' perform different functions (e.g. add, format, or style different kinds of content like text or media, customize layouts, etc.) and you will ultimately be able to build an entire custom site by combining different blocks (like building stuff with lego blocks).

Blocks will eventually replace all other website-building elements of WordPress (e.g. widgets) and are the future of customization for the platform.

In <u>version 5.0</u> (released December 2018), WordPress introduced Gutenberg to users through a new *block-based* content editor. When the Gutenberg editor was introduced as part of the core WordPress software, however, millions of users worldwide had become proficient at using its original default content editor (now referred to as the **WordPress Classic Editor**).

So, while WordPress continues to move towards its vision of a complete block-enabled future, it continues to support the WordPress Classic Editor for now and gives users the option of switching between the two.
